10.1.1 Telegram Format ..... 156
10.1.1.1 Field description ..... 156
10.1.2 Value Information Field codes ..... 162
10.1.2.1 Standard VIF codes ..... 162
10.1.2.2 Standard codes for VIFE used with extension indicator FDh ..... 162
10.1.2.3 Standard codes for VIFE ..... 163
10.1.2.4 First manufacturer specific VIFE-codes ..... 163
10.1.2.5 VIFE-Codes for reports of record errors (meter to master) ..... 164
10.1.2.6 VIFE-Codes for object actions (master to meter) ..... 165
10.1.2.7 2:nd manufacturer specific VIFE followed after VIFE 11111000 (F8 hex): ..... 165
10.1.2.8 2:nd manufacturer specific VIFE followed after VIFE 11111001 (F9 hex): ..... 165
10.1.2.9 2:nd manufacturer specific VIFE followed after VIFE 11111110 (FE hex): ..... 167
10.1.3 Communication process ..... 167
10.1.3.1 Selection and secondary addressing ..... 168
10.2 Standard Readout of Meter Data ..... 170
10.2.1 Example of the 1st telegram (all values are hexadecimal) ..... 170
10.2.2 Example of 2 nd telegram (all values are hexadecimal) ..... 174
10.2.3 Example of 3rd telegram (all values are hexadecimal) ..... 178
10.2.4 Example of the 4th telegram (all values are hexadecimal) ..... 183
10.2.5 Example of the 5th telegram (all values are hexadecimal) ..... 186
10.2.6 Example of the 6th telegram (all values are hexadecimal) ..... 189
10.2.7 Example of the 7th telegram (all values are hexadecimal) ..... 193
10.2.8 Example of the 8th telegram (all values are hexadecimal ..... 196
10.2.9 Example of the 9th telegram (all values are hexadecimal ..... 199
10.3 Special Readout of Meter Data ..... 202
10.3.1 Readout of Load Profile Data ..... 203
10.3.1.1 Examples of Readouts of Load Profile Data ..... 208
10.3.2 Readout of Demand Data ..... 210
10.3.2.1 Examples of Readouts of Demand Data ..... 211
10.3.3 Readout of Previous Values ..... 213
10.3.3.1 Examples of Readouts of Previous Values ..... 215
10.3.4 Readout of Event Log Data ..... 218
10.3.4.1 Example of readout of log data ..... 220
10.3.5 Readout of Current Harmonics ..... 221
10.3.5.1 Examples of Readouts of Current Harmonics Data ..... 223
10.3.6 Readout of Voltage Harmonics ..... 227
10.3.6.1 Examples of readout of voltage harmonics data ..... 228
10.4 Sending Data to the Meter ..... 233
10.4.1 Set tariff ..... 233
10.4.2 Set primary address ..... 234
10.4.3 Change baud rate ..... 234
10.4.4 Reset power fail counter ..... 235
10.4.5 Set Current transformer (CT) ratio - numerator ..... 235
10.4.6 Set voltage transformer (VT) ratio - numerator ..... 236
10.4.7 Set current transformer (CT) ratio - denominator ..... 236
10.4.8 Set voltage transformer (VT) ratio - denominator ..... 237
10.4.9 Select status information ..... 237
10.4.10 Reset of stored state for input 1 ..... 238
10.4.11 Reset of stored state for input 2 ..... 238
10.4.12 Reset of stored state for input 3 ..... 239
10.4.13 Reset of stored state for input 4 ..... 239
10.4.14 Reset of input counter 1 ..... 240
10.4.15 Reset of input counter 2 ..... 240
10.4.16 Reset of input counter 3 ..... 241
10.4.17 Reset of input counter 4 ..... 241
10.4.18 Set output 1 ..... 242
10.4.19 Set output 2 ..... 242
10.4.20 Set output 3 ..... 243
10.4.21 Set output 4 ..... 243
10.4.22 Reset power outage time ..... 244
10.4.23 Send password ..... 244
10.4.24 Set password ..... 244
10.4.25 Set date and time ..... 245
10.4.26 Set date ..... 246
10.4.27 Reset demand, previous values, load profile and logs ..... 246
10.4.28 Reset resettable active energy import ..... 247
10.4.29 Reset resettable active energy export ..... 248
10.4.30 Reset resettable reactive energy import ..... 248
10.4.31 Reset resettable reactive energy export ..... 249
10.4.32 Freeze demand ..... 249
10.4.33 Set write access level ..... 250
10.4.34 Set tariff source ..... 250
10.4.35 Set CO2 conversion factor ..... 251
10.4.36 Set currency conversion factor ..... 251

## Chapter 1: Product Overview

Overview
This chapter describes the parts of the meter and the different meter types.

In this chapter The following topics are covered in this chapter:
$\qquad$
1.1 Meter Parts

10
1.2 Meter Types ....................................................................................... 12

### 1.1 Meter Parts

## Illustration

The parts of the meter are shown in the illustration below:

Parts description The following table describes the parts of the meter:

| Item | Description | Comments |
| :---: | :--- | :--- |
| 1 | Terminal for communication connection |  |
| 2 | Terminal for input/output connection |  |
| 3 | Sealing point. | Seal thread can be used to seal the <br> cover. |
| 4 | Sealable terminal cover | Protective cover with printed wiring <br> diagram on the inside. |
| 5 | LED | Flashes in proportion to the energy <br> measured. |
| 6 | Set button | Enter configuration mode |
| 7 | Sealable terminal cover | Protective cover with printed wiring <br> diagram on the inside |
| 8 | Terminal block | Terminal for all voltages and cur- <br> rents |
| 9 | Sealable cover | To protect the LCD and seal the set <br> button |

| Item | Description | Comments |
| :---: | :--- | :--- |
| 10 | Product data | Contains data about the meter type |
| 11 | OK button | Perform an action or choose a menu |
| 12 | Down button | Toggle down (toggle right in the <br> main menu) |
| 13 | Up button | Toggle up (toggle left in the main <br> menu) |
| 14 | Exit button | Exit to the previous menu or toggle <br> between default and main menu. |
| 15 | Display | LCD for meter reading |
| 16 | optical communication interface | For IR communication |
| 17 | Sealing |  |

### 1.2 Meter Types

## Main groups

The A41/A42 meters are divided into two main groups:

- Direct connected meters for currents $\leq 80 \mathrm{~A}$.
- Transformer connected meters for currents $>80 \mathrm{~A}$ using external current transformers with secondary current $\leq 6 \mathrm{~A}$ and optional voltage transformers.

Subgroups The main meter groups are further divided into subgroups depending on the functionality of the respective meter:

| Subgroup | Functionality |
| :--- | :--- |
| Platinum | Reactive energy, Harmonics, Configurable I/O (except the 690V meter <br> which has fixed I/O), Advanced clock functions (load profiles), Basic clock <br> functions (Tariff control, Previous values, Max. demand, Event log), Class <br> 0.5 or Class 1, Tariffs, Fixed I/O, Resettable registers, Import/export of en- <br> ergy, Active energy, Pulse output/alarm |
| Gold | Basic clock functions (Tariff control, Previous values, Max. demand, Event <br> log), Class 0.5 or Class 1, Tariffs, Fixed I/O, Resettable registers, Import/ <br> export of energy, Active energy, Pulse output/alarm |
| Silver | Class 0.5 or Class 1, Tariffs, Fixed I/O, Resettable registers, Import/export <br> of energy, Active energy, Pulse output/alarm |
| Bronze | Import/export of energy, Active energy, Class 1, Pulse output/alarm |
| Steel | Active energy, Class 1, Pulse output/alarm |

## Product label

Product label information

The meter type information that is reflected on the labels on the meter is shown in the picture below:

The information on the product label is explained in the table below:

| Item | Description |
| :---: | :--- |
| 1 | Import/export of energy |
| 2 | 3-element metering |
| 3 | 2-element metering |
| 4 | 1-element metering |
| 5 | LED |
| 6 | Pulse output |
| 7 | Protection class II |
| 8 | Declaration of product safety |
| 9 | Type designation |
| 10 | Serial number |
| 11 | Accuracy active energy |

| Item | Description |
| :---: | :--- |
| 12 | Accuracy reactive energy |
| 13 | Voltage |
| 14 | Current |
| 15 | Frequency |
| 16 | LED pulse frequency |
| 17 | Pulse frequency |
| 18 | Temperature range |
| 19 | Date of manufacture (year and week) |
| 20 | ABB ID |
| 21 | Notified body |
| 22 | MID and year of verification |

## Chapter 2: Installation

Overview
This chapter describes how to mount the A41/A42 meters and how to connect them to an electricity network. The chapter also contains information about how to perform a basic configuration of the meter.

Information about how to connect I/O and communication options is also included in this chapter.

In this chapter The following topics are covered in this chapter:
2.1 Mounting the Meter
16
2.2 Environmental Considerations .............................................................. 18
2.3 Installing the Meter .............................................................................. 19
2.3.1 Configuring the meter ............................................................... 20
2.4 Wiring Diagrams ................................................................................ 21
2.4.1 Direct connected meters ............................................................. 21
2.4.2 Transformer connected meters without voltage transformer ..... 22
2.4.3 Transformer connected meters with voltage transformer .......... 23
2.4.4 Inputs/outputs ........................................................................... 25
2.4.5 Communication ........................................................................... 26

### 2.1 Mounting the Meter

## General

This section describes different ways to mount the A41/A42 meters. For some methods of mounting additional accessories are needed. For further information about accessories, refer to the Main Catalog (2CMC480001C0201).

DIN-rail mounted
The A41/A42 meters are intended to be mounted on a DIN-rail (DIN 50022). If this method of mounting is used no extra accessories are needed and the meter is fastened by snapping the DIN-rail lock onto the rail.

## DIN-rail

Wall mounted

The following picture shows a DIN-rail.

The recommended way to mount the meter on a wall is to mount a separate DINrail on the wall and then mount the meter on the rail.

Flush mounted To flush-mount the meter a flush-mount kit should be used.

Flush-mount kit The following picture shows a flush-mount kit.

### 2.2 Environmental Considerations

## Ingress protection

To comply with the protection requirements the product must be mounted in protection class IP 51 enclosures, or better, according to IEC 60259.

## Mechanical environment

In accordance with the Measuring Directive (2004/22/EC), the product complies with M1, which means that it can be operated in "...locations with vibration and shocks of low significance, e.g. for instruments fastened to light suporting structures subject to negligible vibrations and shocks transmitted from local blasting or pile-driving activities, slamming doors, etc."

## Electromagnetic environment

In accordance with the Measuring Directive (2004/22/EC), the product complies with E2, which means that it can be operated "...in locations with electro magnetic disturbances corresponding to those likely to be found in other industrial buildings."

## Climatic environment

In order to work properly the product should not be operated outside the specified temperature range of $-40^{\circ} \mathrm{C}-+70^{\circ} \mathrm{C}$.

In order to work properly the product should not exposed to humidity exceeding the specified $75 \%$ yearly average, $95 \%$ on 30 days/year.

### 2.3 Installing the Meter

## Installation

 requirements
## Install the meter

Warning - Electrical equipment should only be installed, accessed, serviced and maintained by qualified electrical personnel.
Working with high voltage is potentially lethal. Persons subjected to high voltage may suffer cardiac arrest, burn injuries, or other severe injuries. To avoid such injuries, make sure to disconnect the power supply before you start the installation.

Warning - For safety reasons it is recommended that the equipment is installed in a way that makes it impossible to reach or touch the terminal blocks by accident.
The best way to make a safe installation is to install the unit in an enclosure. Further, access to the equipment should be limited through use of lock and key, controlled by qualified electrical personnel.

Warning - The meters must always be protected by fuses on the incoming side.
In order to allow for maintenance of transformer rated meters, it is recommended that there should be a short circuiting device installed near the meter.

Meters with wireless communication should not be installed closer than 20 cm from people.

Follow the steps in the table below to install and verify the installation of the meter:

| Step | Action |
| :--- | :--- |
| 1 | Switch off the mains power. |
| 2 | Place the meter on the Din rail and make sure it snaps onto it. |
| 3 | Strip the cable insulation to the length that is indicated on the meter. |
| 4 | Connect the cables according to the wiring diagram that is printed on the meter <br> and tighten the screws (2.5 Nm for direct connected meters and 2 Nm for trans- <br> former connected meters). |
| 5 | Install the circuit protection. See table 2:1 below for the correct fuse. |
| 6 | If inputs/outputs are used, connect the cables according to the wiring diagram <br> that is printed on the meter and tighten the screws (0.25 Nm). Then connect to <br> an external power supply (max 240V). |
| 7 | If communication is used, connect the cables according to the wiring diagram <br> that is printed on the meter and tighten the screws (0.25 Nm). |
| Verify the installation |  |
| 8 | Check that the meter is connected to the specified voltage and that voltage <br> phase connections and the neutral (if used) are connected to the correct termi- <br> nals. |
| 9 | For a transformer connected meter, check that the current direction of the pri- <br> mary and secondary current of the external transformers is correct. Also check <br> that the transformers are connected to the correct meter terminals. |

| Step | Action |
| :--- | :--- |
| 10 | Switch on the power. If a warning symbol is displayed, refer to the error codes <br> in Troubleshooting. |
| 11 | Under the menu item "Instantaneous Values" on the meter, check that the volt- <br> ages, currents, power and power factors are reasonable and that the power di- <br> rection is what to be expected (the total power should be positive for a load that <br> consumes energy). When doing the check the meter should be connected to <br> the intended load, preferably a load with a current above zero on all phases to <br> make the check as complete as possible. |

Circuit protection Use the information in this table to select the correct fuse for the circuit protection.
Table: 2:1

| Meter type | Max circuit protection |
| :--- | :--- |
| Direct connected | 80 A MCB, C characteristic or 80 A fuse type gL-gG |
| Transformer connected | 10 A MCB, B characteristic or Diazes, fast. |

### 2.3.1 Configuring the meter

## Default settings

For information about how to change the default settings of the meter, refer to the chapter called Meter Settings.

Default settings
The following table lists the default settings of the meter that normally need to be changed. Check the settings of the meter to see if they need to be reconfigured.

| Parameter | Direct connected meters | Transformer connected meters |
| :--- | :--- | :--- |
| Clock | --- | --- |
| Ratios VT | --- | 1 |
| Ratios CT | --- | 1 |
| Pulse frequency | 10 | 10 |
| Pulse length | 100 ms | 100 ms |

### 2.4 Wiring Diagrams

General
This section describes how to connect the different types of meters to an an electricity network. The terminal numbers in the wiring diagrams listed below correspond to the marking on the terminal block of the meter.

### 2.4.1 Direct connected meters

2-wire connection The following diagram shows a 2-wire connection of a direct connected 1-phase meter:

### 2.4.2 Transformer connected meters without voltage transformer

## 2-wire connection

The following diagram shows a 2-wire connection of a transformer connected 3phase meter:

### 2.4.3 Transformer connected meters with voltage transformer

## 2-wire connection

The following diagram shows a 2-wire connection of a transformer connected 3phase meter with voltage transformers:

### 2.4.4 Inuts/outputs

## 2 outputs, 2

 inputs

4 configurable inputs/outputs

## 1 output

### 2.4.5 Communication

## RS 485

## M-Bus

M-Bus
$37 \quad 36$
$\square$

## Chapter 3: User Interface

Overview
This chapter describes the different display views and the menu structure.

In this chapter The following topics are covered in this chapter:
$\qquad$3.1 Display28

## 3．1 Display

## General

## Default menu

## Energy values

The display contains two main views，the Default menu and the Main menu．Use the Exit button $⿴ 囗 十$ to toggle between the views．In both views a number status icons are displayed in the upper part of the display．These icons are explained in table 3：1 below．In the same manner the bottom part of the display has an explan－ atory text to describe what is shown or highlighted at the moment．

The following image shows an example of the layout of the Default menu：

The following table explains the content of the 20 available pages in the Default menu：

| Page | Unit | Text on display | Explaining text |
| :--- | :--- | :--- | :--- |
| $1 / 20$ | kWh | ACT．NRG．IMP．TOT | Measures the total <br> imported active en－ <br> ergy． |
| $2 / 20$ | kWh | ACT．NRG．EXP．TOT | Measures the total <br> exported active en－ <br> ergy． |
| $3 / 20$ | kvarh | REACT．NRG．IMP．TOT | Measures the total <br> imported reactive en－ <br> ergy． |
| $4 / 20$ | kVarh | REACT．NRG．EXP．TOT | Measures the total <br> exported reactive en－ <br> ergy． |
| $5 / 20$ | kWh | ACT．NRG．IMP．TAR2 | Measures the im－ <br> ported active energy <br> for tariff 1 |
| 6／20 | Measures the im－ <br> ported active energy <br> for tariff 2 |  |  |
| $7 / 20$ | kWh | ACT．NRG．IMP．TAR3 | Measures the im－ <br> ported active energy <br> for tariff 3 |

| Page | Unit | Text on display | Explaining text |
| :---: | :---: | :---: | :---: |
| 8/20 | kWh | ACT.NRG.IMP.TAR4 | Measures the imported active energy for tariff 4 |
| 9/20 | kWh | ACT.NRG.EXP.TAR1 | Measures the exported active energy for tariff 1 |
| 10/20 | kWh | ACT.NRG.EXP.TAR2 | Measures the exported active energy for tariff 2 |
| 11/20 | kWh | ACT.NRG.EXP.TAR3 | Measures the exported active energy for tariff 3 |
| 12/20 | kWh | ACT.NRG.EXP.TAR4 | Measures the exported active energy for tariff 4 |
| 13/20 | kvarh | REACT.NRG.IMP.TAR1 | Measures the imported reactive energy for tariff 1 |
| 14/20 | kvarh | REACT.NRG.IMP.TAR2 | Measures the imported reactive energy for tariff 2 |
| 15/20 | kvarh | REACT.NRG.IMP.TAR3 | Measures the imported reactive energy for tariff 3 |
| 16/20 | kvarh | REACT.NRG.IMP.TAR4 | Measures the imported reactive energy for tariff 4 |
| 17/20 | kvarh | REACT.NRG.EXP.TAR1 | Measures the exported reactive energy for tariff 1 |
| 18/20 | kvarh | REACT.NRG.EXP.TAR2 | Measures the exported reactive energy for tariff 2 |
| 19/20 | kvarh | REACT.NRG.EXP.TAR3 | Measures the exported reactive energy for tariff 3 |
| 20/20 | kvarh | REACT.NRG.EXP.TAR4 | Measures the exported reactive energy for tariff 4 |

Status Icons The status icons that can be seen the display are explained in the following table.
Table: 3:1

| Icon |  | Indication |
| :---: | :---: | :--- |
| $\Theta \oplus \oplus$ | Active quadrant. |  |
| $\square$ | Communication is in progress. The meter is either sending <br> or receiving information. |  |

| Icon | Indication |
| :---: | :---: |
| 2\% | Metering in progress. Clockwise rotation indicates import. Counter clockwise rotation indicates export. |
| $1 \rightarrow 1-1 \quad 2 \rightarrow 2-2 \quad 3 \rightarrow 3-3$ | Arrows indicate direction of current per phase. Arrow left = export, arrow right = import. A digit without arrow indicates that only voltage is connected to the phase. |
| T1 T2 T3 T4 | Active tariff. |
| $\triangle$ ! $\triangle$ | Error, warning, note |
| 8 | Transformer ratio (only on transformer rated meters) |

Main menu The following image shows an example of the layout of the main menu:

Main menu icons Depending on the meter type all or a subset of the following icons may be available in the display:

| Icon | Explanation |
| :---: | :---: |
| kWh | Energy registers |
| $7$ | Instantaneous values |
| 表 | Stored values |
| \% | Harmonics |
| $\bigcirc$ | I/O |
| $\Gamma$ | Status |
| \% | Settings |

Main menu structure

The following table describes the main menu structure and its content:

| $\mathrm{kWh}$ | $7$ | $\nexists$ | 40 | $\leftrightarrow$ |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Active Energy Import L1-L3 | Active Power | Previous Values | THD Voltage | I/O 1 | System Log | Clock |
| Active Energy Export L1-L3 | Reactive Power | Load Profiles | Harmonics Voltage L1-L3 | I/O 2 | Event Log | Ratios |
| Active Energy Net L1L3 | Apparent Power | Demand | THD Current | I/O 3 | Net Quality Log | Wires |
| Reactive Energy Import L1-L3 | Phase Voltage |  | Harmonics Current L1-L3 | I/O 4 | System Status | Pulse Output |
| Reactive Energy Export L1-L3 | Main Voltage |  |  |  | Audit Log | I/O |
| Reactive Energy Net L1-L3 | Current |  |  |  | Settings Log | Alarm |

## Chapter 4: Meter Settings

This chapter gives an overview of the meter settings and configuration options.

In this chapter The following topics are covered in this chapter:
4.1 Settings and Configurations
32
4.1.1 Setting Date .............................................................................. 32
4.1.2 Setting Time .............................................................................. 33
4.1.3 Setting Ratios ........................................................................... 33
4.1.4 Setting Pulse Output ................................................................. 33
4.1.5 Setting I/O ................................................................................... 34
4.1.6 Setting Alarm ............................................................................ 35
4.1.7 Setting Currency/CO2 ............................................................... 37
4.1.8 Setting RS485 .......................................................................... 38
4.1.9 Setting IR Side ......................................................................... 38
4.1.10Setting Upgrade Consent ......................................................... 40
4.1.11Setting Pulse LED ..................................................................... 40
4.1.12Setting Tariff .............................................................................. 40
4.1.13Setting Previous Values ........................................................... 41
4.1.14Setting Load Profile .................................................................. 41
4.1.15Setting Demand ........................................................................ 42
4.1.16Resetting Resettable Registers ................................................. 42

### 4.1 Settings and Configurations

Configurable functions

Depending on the meter type, all or a subset of the following functions can be configured:

| Clock |  |
| :--- | :--- |
| Ratios |  |
| Wires |  |
| Pulse output |  |
| I/O |  |
| Alarm |  |
| Currency/CO 2 |  |
| RS485 |  |
| IR Side |  |
| Wireless |  |
| Upgrade Consent |  |
| Pulse LED |  |
| Tariff |  |
| Previous Values |  |
| Load profile |  |
| Demand |  |
| Resettable registers |  |

When setting a value, the set button is used to activate the set-option. The $\nabla$ and $\Delta$ buttons are used to change the options that can be set, such as on or off. If the set-option involves setting a number, for example a alarm limit, the $\Delta$ button is used to increase a digit, and the $\sigma$ button is used to decrease a digit. The button is used to toggle between digits. The option/digit that is active for setting is marked with a underscore. When the underscore on the last option has dissapeared, the setting has been performed.

### 4.1.1 Setting Date

To set the date, perform the following steps:

1. Choose the Settings icon in the main menu, press ${ }^{6}$.
2. Choose "Clock", press or.
3. The display will now show the date.
4. Set the date.

### 4.1.2 Setting Time

To set the time, perform the following steps:

1. Choose the Settings icon in the main menu, press or.
2. Choose "Clock", press ■®.
3. The display will now show the date. Press $\square$ to get to the time-menu.
4. Set the time.

### 4.1.3 Setting Ratios

To set the ratios, perform the following steps:

1. Choose the Settings icon in the main menu, press
2. Choose "Ratios", press 四.
3. The display will show the quantity Current (CT on the display) and the ratio. To change the ratio, press see table $4: 1$ for interval.
4. Press $\square$. The display will show the quantity Voltage (VT on the display) and the ratio. To change the ratio, press See table 4:1 for interval.
Table: 4:1

| Option | Interval |
| :--- | :--- |
| Transformer Current (CT) | $1-9999 / 1-9$ |
| Transformer Voltage (VT) | $1-999999 / 1-999$ |

### 4.1.4 Setting Pulse Output

To set the pulse output, perform the following steps:

1. Choose the Settings icon in the main menu, press
2. Choose "Pulse out" (Pul.out on the display), press ${ }^{-6}$.

The display will show what type of energy is measured on pulse output 1 . Depending on meter type, the available choices are:

| Act.Nrg.Imp on the display | Active energy imported |
| :--- | :--- |
| Act.Nrg.Exp on the display | Active energy exported |
| React.Nrg.Imp on the display | Reactive energy imported |
| React.Nrg.Exp on the display | Reactive energy exported |
| Inactive on the display | Inactive |

3. Set the energy type.
4. Press $\square$ once to get to the next menu. The display will show the frequency. The intervall that can be set is $0-999999 \mathrm{imp} / \mathrm{kWh}$ or $0-999999 \mathrm{imp} / \mathrm{MWh}$. Set the frequency and quantity.
5. Press $\square$ once to get to the next menu. The display will show the pulse length in milliseconds. The intervall for the pulse length is from 10 to 990 ms . Set the pulse length.
6. Press $\square$ once to get to the next menu. The display will show the setting for pulse output 1. Depending on the meter type, the available choices are:

| 4 configurable I/Os | 4 static I/Os | 1 static I/O |
| :--- | :--- | :--- |
| No output | No output | No output |
| Out 1 | Out 1 | Out 1 |
| Out 2 | Out 2 | - |
| Out 3 | - | - |
| Out 4 | - | - |

Note - If choosing an I/O that is not pulse outout configured, the option is set to "no ouput" when pressing the 0 button.
7. The first pulse output is now fully configured. Depending on the meter type, up to four pulse outputs can be set. If your meter supports multiple pulse outputs, use to toggle down to the remaining pulse outputs and set them the same way as pulse output 1.

### 4.1.5 Setting I/O

To set the I/O, perform the following steps:

1. Choose the Settings icon in the main menu, press ${ }^{6}$.
2. Choose "I/O", press ${ }^{6}$.
3. The display will now show I/O 1 . To change $\mathrm{I} / \mathrm{O}$, use $\Delta$ or $⿴$. To set an $\mathrm{I} /$ O, press the ser button. Depending on the meter type, different choices can be made for the I/O, see table 4:2.
Table: 4:2

| I/O | Available choices |  |
| :--- | :--- | :--- |
| 1 static I/O | • Alarm out |  |
|  | • Communication out |  |
|  | (Comm.out on display) |  |
|  | • Pulse out Pul.out on |  |
|  | display) |  |
|  | • Tariff out |  |
|  | • Always on |  |
|  | • Always off |  |

1. I/O 1 and I/O 2 are set to static output by default.I/O 3 and 4 are set to static output by default and cannot be configured. I/O 3 and I/O 4 are not shown in the display.

### 4.1.6 Setting Alarm

To set the alarm, perform the following steps:

1. Choose the Settings icon in the main menu, press 0 .
2. Choose "Alarm", press or.
3. The display will show what quantity shall be measured. Depending on the meter type, different quantities are available. See table 4:3 and table 4:4 for available quantities and interval/units for the different quantities. Set the desired quantity.
Table: 4:3

| 1-phase meter |  | Interval/Unit |
| :--- | :--- | :--- |
| Inactive |  | - |
| Current L1 |  | $0.01-99.99 \mathrm{~A} / \mathrm{kA}$ |
| Voltage L1 |  | $0.1-999.9 \mathrm{~V} / \mathrm{kV}$ |
| Harmonic voltage L1 |  | $0.1-999.9 \mathrm{~V} / \mathrm{kV}$ |
| Active power total |  | $0-9999 \mathrm{~W} / \mathrm{kW} / \mathrm{MW}$ |
| Reactive power total |  | $0-9999 \mathrm{~W} / \mathrm{kW} / \mathrm{MW}$ |
| Apparent power total |  | $0-9999 \mathrm{~W} / \mathrm{kW} / \mathrm{MW}$ |
| Power factor total |  | $0.000-0.999$ |

Table: 4:4

| 3-phase meter |  | Interval/Unit |
| :--- | :--- | :--- |
| Inactive |  | - |
| Active power total |  | $0-9999 \mathrm{~W} / \mathrm{kW} / \mathrm{MW}$ |
| Reactive Power Total |  | $0-9999 \mathrm{~W} / \mathrm{kW} / \mathrm{MW}$ |
| Apparent Power Total |  | $0-9999 \mathrm{~W} / \mathrm{kW} / \mathrm{MW}$ |
| Power factor total |  | $0.000-0.999$ |
| Current L1 |  | $0.01-99.99 \mathrm{~A} / \mathrm{kA}$ |
| Current L2 |  | $0.01-99.99 \mathrm{~A} / \mathrm{kA}$ |
| Current L3 |  | $0.01-99.99 \mathrm{~A} / \mathrm{kA}$ |
| Current N |  | $0.01-99.99 \mathrm{~A} / \mathrm{kA}$ |
| Voltage L1 |  | $0.1-999.9 \mathrm{~V} / \mathrm{kV}$ |
| Voltage L2 |  | $0.1-999.9 \mathrm{~V} / \mathrm{kV}$ |
| Voltage L3 |  | $0.1-999.9 \mathrm{~V} / \mathrm{kV}$ |
| Voltage L1-L2 |  | $0.1-999.9 \mathrm{~V} / \mathrm{kV}$ |
| Voltage L2-L3 |  | $0.1-999.9 \mathrm{~V} / \mathrm{kV}$ |
| Voltage L1-L3 |  | $0.1-999.9 \mathrm{~V} / \mathrm{kV}$ |
| Harmonicvoltage L1 |  | $0.1-999.9 \mathrm{~V} / \mathrm{kV}$ |
| Harmonic voltage L2 |  | $0.1-999.9 \mathrm{~V} / \mathrm{kV}$ |
| Harmonic voltage L3 |  | $0.1-999.9 \mathrm{~V} / \mathrm{kV}$ |
| Harmonic voltage L1-L2 |  | $0.1-999.9 \mathrm{~V} / \mathrm{kV}$ |
| Harmonic voltage L2-L3 |  | $0.1-999.9 \mathrm{~V} / \mathrm{kV}$ |
| Harmonic voltage L1-L3 |  | $0.1-999.9 \mathrm{~V} / \mathrm{kV}$ |
| Active power L1 |  | $0-9999 \mathrm{~W} / \mathrm{kW} / \mathrm{MW}$ |
| Active power L2 |  | $0-9999 \mathrm{~W} / \mathrm{kW} / \mathrm{MW}$ |
| Active power L3 |  | $0-9999 \mathrm{~W} / \mathrm{kW} / \mathrm{MW}$ |
| Reactive power L1 |  | $0-9999 \mathrm{~W} / \mathrm{kW} / \mathrm{MW}$ |
| Reactive power L2 |  | $0-9999 \mathrm{~W} / \mathrm{kW} / \mathrm{MW}$ |
| Reactive power L3 |  | $0-9999 \mathrm{~W} / \mathrm{kW} / \mathrm{MW}$ |
| Apparent power L1 |  | $0.0999 \mathrm{~W} / \mathrm{kW} / \mathrm{MW}$ |
| Apparent power L2 |  |  |
| Apparent power L3 |  |  |
| Power factor L1 |  |  |
| Power factor L2 |  |  |
| Power factor L3 |  |  |
|  |  |  |

4. Press once to get to the next menu. The display will show what level the alarm will trigger on. Set the alarm level.
5. Press once to get to the next menu. The display will show the time that the measured value has to be higher than the limit set in the previous step in order for the alarm to trigger. Set the time limit.
6. Press $\square$ once to get to the next menu. The display will show what level the alarm will cease on.Set the alarm level.
7. Press $\nabla$ once to get to the next menu. The display will show the time that the measured value has to be lower than the limit set in the previous step in order for the alarm to cease. Set the time limit.
8. Press $⿴ 囗$ once to get to the next menu.The display will show if the alarm will be logged or not. The available values are "on" and "off". Set logging to on or off.
9. Press $\square$ once to get to the next menu. The display will show what output the alarm is set on (or if no output is set). The available choices are dependent on meter type, see table 4:5.
Table: 4:5

| 4 configurable I/Os | 4 static I/Os | 1 static I/O |
| :--- | :--- | :--- |
| No output | No output | No output |
| Out 1 | Out 1 | Out 1 |
| Out 2 | Out 2 |  |
| Out 3 |  |  |
| Out 4 |  |  |

Note - If choosing an I/O that is not alarm configured, the option will be set to "no ouput" when pressing the set button.
10.The first alarm is now fully configured. Depending on the meter type, up to four alarms can be set. If your meter supports multiple alarms, use $\nabla$ and $\Delta$ to set the remaining alarms the same way as the first alarm was configured.

### 4.1.7 Setting Currency/CO2

By setting a conversion factor for Currency $/ \mathrm{CO}_{2}, \mathrm{kWh}$ is converted to currency and/or kg CO 2 .
To set currency/ $\mathrm{CO}_{2}$, peform the following steps:

1. Choose the Settings icon in the main menu, press ${ }^{6}$.
2. Choose "Currency/CO2" (Curr/CO2 on the display), press 0 .
3. The display will show price in currency per unit.
4. Press ser to set the the conversion factor and the quantity.
5. Use $\square$ to get to the next page. The page will display the $\mathrm{CO}_{2}$ emissions in kg per kWh .
6. Press to set the conversion factor for $\mathrm{CO}_{2}$.

## 4．1．8 Setting RS485

The RS485 uses the EQ－Bus and the Modbus protocol to communicate．To set the RS485 communication depending on protocol，perform the following steps：

| Step | EQ－Bus | Modbus |
| :---: | :---: | :---: |
| 1 | Choose the Settings icon in the main menu，press | Choose the Settings icon in the main menu，press |
| 2 | Choose communication interface． | Choose communication inter－ face． |
| 3 | Choose EQ－Bus． | Choose Modbus． |
| 4 | Press $⿴ 囗 ⿰ 丿 ㇄$ menu．The display to will show the ne baudrate．See table Table 4：6 for baudrate options．Set baudrate | Press once to get to the next menu．The display will show the baudrate．See Table 4：6 for baudrate options．Set baudrate |
| 5 | Press - once to get to the next menu．The display will show the address．See Table 4：6 for address range．Set address． | Press $⿴ 囗 ⿰ 丿 ㇄$ menu．The display will show the address．See Table 4：6 for address range．Set address． |
| 6 | Press $⿴ 囗 ⿰ 丿 ㇄$ menu．The display will show the Oct．TO．See Table 4：6 for options． Set Oct．TO | Press $⿴ 囗 ⿰ 丿 ㇄$ menu．The display will show the Parity．See Table 4：6 for op－ tions．Set Parity． |
| 7 | Press - once to get to the next menu．The display will show the Inac．TO．See Table 4：6 for options． Set Inac．TO |  |
|  | Press $\square$ once to get to the next menu．The display will show if the password is to be reset．See Table 4：6 for options．Set the option |  |

## 4．1．9 Setting IR Side

The IR Side uses the M－Bus and the EQ－Bus ${ }^{i}$ protocol to communicate．To set the IR Side communication depending on protocol，perform the following steps：

| Step | M－Bus | EQ－Bus |
| :--- | :--- | :--- |
| 1 | Choose the Settings icon in the <br> main menu，press | Choose the Settings icon in the <br> main menu，press |
| 2 | Choose IR Side，press $\sigma$. | Choose IR Side，press |

i．EQ－Bus is a communication protocol designed for internal communication with ABB meters． The protocol is based on the following IEC standards；62056－42，62056－46，62056－53，62056－ 61，62056－62．

| Step | M－Bus | EQ－Bus |
| :---: | :---: | :---: |
| 5 | Press $\square$ once to get to the next menu．The display will show the address．See Table 4：6 for address range．Set address． | Press - once to get to the next menu．The display will show the address．See Table 4：6 for address range．Set address． |
| 6 | Press $⿴ 囗 ⿰ 丿 ㇄$ menu．The display will show the access level．See Table 4：6 for op－ tions．Set the access level． | Press once to get to the next menu．The display will show the Oct．TO．See Table 4：6 for options． Set Oct．TO． |
| 7 | Press $\square$ once to get to the next menu．The display will show the Send status info．See Table 4：6 for options．Set the send info status． | Press $⿴ 囗 ⿰ 丿 ㇄$ menu．The display will show the Inac．TO．See Table 4：6 for options． Set Inac．TO． |
|  | Press $⿴ 囗 ⿰ 丿 ㇄$ menu．The display will show if the password is to be reset．See Table 4：6 for options．Set the op－ tion． | Press $\square$ once to get to the next menu．The display will show pass－ word reset option．Set if the pass－ word shall be reset or not． |
|  | Press $⿴ 囗$ once to get to the next menu．The display will show the upgrade mode．See Table 4：6 for options．Set the upgrade mode． |  |

$\qquad$

Protocol details The following table shows the intervals and options for the different protocols：
Table：4：6

| Protocol | Access level | Upgrade mode | Send Status Info | Reset password | Parity | Baudrate | Address | Inter octet timeout （ms） | Inactivity timeout （ms） |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| EQ－Bus <br> （when <br> used <br> through <br> RS485 | － | － | － | Yes，No | － | 1200, 2400, 4800, 9600, 19200, 38400, 57600, 115200, 125000, 230400, 250000, 460800 | 16－16381 | 20－6000 | 0－2000 |
| Modbus <br> （when <br> used <br> through <br> RS485 | － | － | － | － | None， Odd， Even | 1200, 2400, 4800, 9600, 19200, 38400, 57600, 115200 | 1－247 | － | － |

| Protocol | Access level | Upgrade mode | Send Status Info | Reset password | Parity | Baudrate | Address | Inter octet timeout (ms) | Inactivity timeout (ms) |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| M-Bus <br> (when <br> used through IRSide | Open, Password, Closed | Active, Not Active | AIways, Never, When not OK | Yes, No | - | $\begin{aligned} & \hline 2400, \\ & 4800, \\ & 9600, \\ & 19200, \\ & 38400 \end{aligned}$ | 1-250 | - | - |
| EQ-Bus <br> (when <br> used through IRSide) | - | - | - | Yes, No | - | 1200, 2400, 4800, 9600, 19200, 38400, 57600, 115200, 125000, 230400 |  |  |  |

### 4.1.10 Setting Upgrade Consent

Upgrade Consent can be set to Allowed or Not Allowed. Setting it to Allowed means you agree to updates of the meter. Setting it to Not Allowed means no upgrades will take place.

To set Upgrade Consent, perform the following steps:

1. Choose the Settings icon in the main menu, press ${ }^{\circ}$.
2. Choose "Upgrade Consent" (Upgr.Cons on the display), press ox.
3. Press ser to set Upgrade Consent.

### 4.1.11 Setting Pulse LED

To set pulse LED, perform the following steps:

1. Choose the Settings icon in the main menu, press ${ }^{6}$.
2. Choose "Pulse LED" (Puls.LED on the display), press or.
3. Press ter th the type of energy that the LED shall indicate on.

### 4.1.12 Setting Tariff

The tariff source can be set to input, clock or communication. To set the tariffs, perform the following steps:

| Step | Input | Clock | Communication |
| :---: | :---: | :---: | :---: |
| 1 | Choose the Settings icon in the main menu, press ${ }^{\circ}$. | Choose the Settings icon in the main menu, press ${ }^{0}$. | Choose the Settings icon in the main menu, press [0. |
| 2 | Choose "Tariff", press | Choose "Tariff", press 四. | Choose "Tariff", press |

| Step | Input | Clock | Communication |
| :--- | :--- | :--- | :--- |
| 3 | Press and choose Input. | Press and choose Clock. <br> If the display says <br> "Config found <br> No reset" <br> then reset the configuration <br> by pressing and choosing <br> "Reset" | Press and <br> choose Comm. |
| 4 | Useto toggle to the first <br> configuration. Four configu- <br> rations are available. Set <br> the tariff that shall be active <br> for each configuration.Press to get to the next <br> page. | The tariff source is <br> now set for commu- <br> nication. |  |
| 5 | - | Set the desired tariffs with <br> start-time and if the tariff is to <br> be used or not. Up to eight <br> tariffs can be set, four for <br> weekdays and four for week- <br> ends. Set at least one tariff <br> for weekedays (Mon-Fri) and <br> one for weekends (Sat-Sun) <br> even if the values are the <br> same. | - |

### 4.1.13 Setting Previous Values

To set set the previous values, perform the following steps:

1. Choose the Settings icon in the main menu, press or.
2. Choose "Previous Values" (Prev.Val. on the display), press ${ }^{\circ}$.
3. Perform the setting. The options are day, week and month.
4. If setting week, use to go to the next step.
5. Set what week-day the snapshot of the values will be taken.

### 4.1.14 Setting Load Profile

To set the load profile, perform the following steps:

1. Choose the Settings icon in the main menu, press $\sigma^{\circ}$.
2. Choose "Load Profiles" (Load Pro on the display), press
3. The first page will show the interval for the quantity active energy imported (Act.Imp.Tot on the display). Up to eight channels (pages) are available to configure, see table below.

| Page | Quantity | On display | Predefined <br> value |
| :--- | :--- | :--- | :--- |
| $1 / 8$ | Active Energy Imported total | Act.Imp.Tot | 15 min |
| $2 / 8$ | Active Energy Exported Total | Act.Exp.Tot | 15 min |
| $3 / 8$ | Reactive Energy Imported Total | React.Imp.Tot | 15 min |
| $4 / 8$ | Reactive Energy Exported Total | React.Exp.Tot | 15 min |
| $5 / 8$ | Input Counter 1 | Inp.Ctr 1 | 1 hours |
| $6 / 8$ | Input Counter 2 | Inp.Ctr 2 | 1 hours |

| Page | Quantity | On display | Predefined <br> value |
| :--- | :--- | :--- | :--- |
| $7 / 8$ | Input Counter 3 | $\operatorname{Inp.Ctr} 3$ | 1 hours |
| $8 / 8$ | Input Counter 4 | Inp.Ctr 4 | 1 hours |

4. Configure the desired channels.

When a configuration has been made, a reset may be required in order to perform a new configuration. To reset the intervals, toggle down to the reset page and perform a reset the same way as performing a setting.

### 4.1.15 Setting Demand

The demand function enables measuring of up to 50 values (channels). Step 1-6 are general for the function and step 7-9 are specific for each channel.

To set the demand, perform the following steps:

1. Choose the Settings icon in the main menu, press 0 .
2. Choose "Demand" (Demand on the display), press
3. Set the period. The available choices are day, week and month. If choosing day, the starting point will be now and the ending point will be 00:00. If choosing month, the starting point will be now and the ending point will be the first of next month at 00:00. If choosing week, the starting point will be now and the ending point will be the set day at 00:00. If choosing week, press $\square$ to get to the page where the day is set. Press $\square$.
4. Set the interval that shall be measured. Press $\nabla$ to continue.
5. Set the subinterval that shall be measured. Press $⿴$ to continue.
6. Set if the previous settings shall be reset. Press $\square$ to continue.
7. Set the quantity that shall be measured. Press to continue.
8. Set the demand type. Press $⿴$ to continue.
9. The demand level will be set automatically.

The first channel is now set. To set the next channel, repeat step 3-9. Up to 50 channels can be set.

### 4.1.16 Resetting Resettable Registers

To reset registers, perform the following steps:

1. Choose the Settings icon in the main menu, press $\sigma^{\circ}$.
2. Choose "Resettable registers" (Rst.Reg on the display), press ${ }^{0}$.
3. The display will show the different registers to reset. Depending on the meter type, the available choices are:

| Register | On the display |
| :--- | :--- |
| Active Energy Imported Total | Act.Imp |
| Active Energy Exported Total | Act.Exp |
| Reactive Energy Imported Total | Rea.Imp |
| Reactive Energy Exported Total | Rea.Exp |

| Register | On the display |
| :--- | :--- |
| Reset all | All |

4. Toggle through the pages and reset the desired registers.

## Chapter 5: Technical Description

## Overview

This chapter contains technical descriptions of the meter functions. Depending of the meter type, the meter may contain all or a subset of the functions described in this chapter.

In this chapter The following topics are covered in this chapter:
5.1 Energy Values
48
5.2 Instrumentation .................................................................................. 50
5.3 Harmonics .......................................................................................... 52
5.4 Alarm .................................................................................................... 56
5.5 Inputs and Outputs ............................................................................. 57
5.6 Internal Clock ....................................................................................... 60
5.7 Logs ................................................................................................... 61
5.8 Demand ............................................................................................... 66
5.9 Previous Values .................................................................................. 68
5.10 Load Profile ........................................................................................ 70

### 5.1 Energy Values

General The energy values are stored in energy registers. The different energy registers can be divided into:

- Registers containing active, reactive or apparent energy
- Registers containing different tariffs or total sum of all tariffs
- Registers containing energy per phase or total sum of all phases
- Resettable registers
- Registers containing momentary or historical value

The energy values can be read via communication or directly in the display with the help of the buttons.

Primary value In transformer connected meters with external current transformers, and sometimes also external voltage transformers, the register value is multiplied by the total transformer ratio before it is presented on the display or sent out via communication. This value is called primary value.

## Presentation of register values

In direct connected meters the energy is usually displayed with a fixed unit and number of decimals (normally kWh , with no decimals).

In transformer connected meters where primary values are displayed, the energy values can be rather big when the total transformer ratio is big. Normally the meter automatically adapts the unit and number of decimals displayed to the value.
In case the energy is displayed with fixed units and number of decimals the energy will "roll over" to zeros when the energy is incremented if all nines are displayed. The meter can however contain more digits internally, which can be read out via communication if the meter is equipped with a communication interface. See the example below where the value 2483756 is displayed, while the internal register contains 192483756.6.

### 5.2 Instrumentation

## Instrumentation

 functionsThe following table shows the complete instrumentation functions of the A41/ A42 meters. Depending on the meter type all or a subset of the following functions are available.

| Instrumentation | 3-phase, 4-wire | 3-phase, 3-wire |
| :---: | :---: | :---: |
| Active power, total | X | X |
| Active power, L1 | X | X |
| Active power, L2 | X |  |
| Active power, L3 | X | X |
| Reactive power, Total | X | X |
| Reactive power, L1 | X | X |
| Reactive power, L2 | X |  |
| Reactive power, L3 | X | X |
| Apparent power, Total | X | X |
| Apparent power, L1 | X | X |
| Apparent power, L2 | X |  |
| Apparent power, L3 | X | X |
| Voltage L1-N | X |  |
| Voltage L2 - N | X |  |
| Voltage L3-N | X |  |
| Voltage L1-L2 | X | X |
| Voltage L3-L2 | X | X |
| Voltage L1-L3 | X |  |
| Current L1 | X | X |
| Current L2 | X |  |
| Current L3 | X | X |
| Current N | X |  |
| Frequency | X | X |
| Power factor, Total | X | X |
| Power factor, L1 | X | X |
| Power factor, L2 | X |  |
| Power factor, L3 | X | X |
| Phase angle power, Total | X | X |
| Phase angle power, L1 | X | X |
| Phase angle power, L2 | X |  |
| Phase angle power, L3 | X | X |
| Phase angle voltage, L1 | X | X |
| Phase angle voltage, L2 | X |  |
| Phase angle voltage, L3 | X | X |
| Phase angle current, L1 | X | X |
| Phase angle current, L2 | X |  |

| Instrumentation | 3-phase, 4-wire | 3-phase, 3-wire |
| :--- | :--- | :--- |
| Phase angle current, L3 | X | X |
| Current quadrant, Total | X | X |
| Current quadrant, L1 | X | X |
| Current quadrant, L2 | X |  |
| Current quadrant, L3 | X | X |
| THD | X | X |
| Harmonic voltage L1 | X | X |
| Harmonic voltage L2 | X |  |
| Harmonic voltage L3 | X | X |
| Harmonic voltage L1-L2 | X | X |
| Harmonic voltage L2-L3 | X | X |
| Harmonic voltage L1-L3 | X |  |
| Harmonic current L1 | X | X |
| Harmonic current L2 | X |  |
| Harmonic current L3 | X | X |
| Harmonic current N | X |  |

Accuracy All instrumentation data accuracy is defined within the voltage range $20 \%$ of the stated nominal voltage and within the current range $5 \%$ of the base current to the maximum current.
The accuracy of all instrumentation data except the voltage and current phaseangles is the same as the stated energy metering accuracy. The accuracy for the voltage and current phase-angles is 2 degrees.

### 5.3 Harmonics

#### Abstract

General The presence of harmonics in voltages and currents may cause a number of unwanted problems. This chapter describes the origin of harmonics, how the negative effects of harmonics can be eliminated and how harmonics is measured.

The harmonics data can be read via communication or directly in the display with the help of the buttons.

## Generation of harmonics

Generators in the power system produce a nearly pure sinusoidal voltage with a frequency near the stated system frequency, normally 50 or 60 Hz . Linear loads, consisting of pure resistors, capacitors and inductors, draw a pure sinusoidal current if the voltage over the load is pure sinusoidal.

A non-linear load, however, draws non-sinusoidal current resulting in a current consisting of several frequencies. One example of a common non-linear load are power supplies in electronic equipment which normally contains rectifier diodes which rectifies the incoming voltage and charges a capacitor. The power supply only draws current at the top of the sine wave when the rectified voltage exceeds the voltage over the capacitor. Another example of a non linear load is a thyristor controlled load, where the current normally is turned on at the voltage zero crossing and turned off sometimes during the sine wave.

These currents are all non-sinusoidal and can be divided into a fundamental part, which is the same as the mains frequency, and high frequency parts, that is harmonics, which have frequency that are integral multiples of the mains frequency.

Harmonics in the current will in turn cause harmonics in the voltage since the mains wires and the generator have an impedance causing a voltage drop that is proportional to the current. It should also be pointed out that if there is harmonics in the voltage, also a linear load will cause harmonics in the current, that have the same magnitude as the voltage harmonics. However, the origin of harmonics in the voltage are non-linear loads.

## Negative effects of harmonics

The presence of harmonics in voltages and currents can cause a number of problems:

- Increased cable losses. At higher frequencies skin and proximity effects increases, resulting in increased losses.
- High current in the neutral wire.
- Motor efficiency and product lifetime will decrease if the voltage contain harmonics.
- In transformers, harmonics will cause higher wire, hysteresis and eddy losses, which could result in efficiency losses up to $50 \%$.
- Voltage harmonic can give higher peak voltages (higher crest factor), causing overvoltage protection devices to trip and in worst case destruction of devices.
- Voltage harmonic can result in decreased product lifetime and in worst case destruction of capacitor banks (used for power factor correction).
- Voltage harmonic can cause malfunction of devices controlled by the voltage, often zero crossings (voltage harmonics can give extra zero crossings).
- Voltage harmonics can produce disturbances within devices having its power supply connected to the mains causing problems.

## Eliminating negative effects of harmonics

Because of the negative effects of harmonics it may be necessary to take actions to decrease the problems. This can be either done by decreasing the harmonics, and/or taking actions that decrease the negative effects of the harmonics.

## Suggested actions

- Increase the size of the neutral conductor if the current is abnormally high due to harmonics.
- Install appropriate filters to isolate loads with high current harmonics.
- Install filters to protect to protect loads that are sensitive to voltage harmonics.
- Oversize generators, motors and transformers to better cope with harmonics.
- Substitute equipment for equipment that generates less current harmonics and is less sensitive to voltage harmonics.

### 5.3.1 Measuring Harmonics

General To detect and eliminate the problems related to presence of harmonics, it's generally necessary to measure the harmonics. Meters that have harmonic measurement enabled measure harmonics on all voltages and currents up to the 16th harmonic and calculates the total harmonic distortion (THD).

## Measuring

Folding distortion Since the meter have limited sampling frequency, presence of harmonics over the 20:th harmonic ( 1 kHz at 50 Hz line frequency) will result in folding distortion and can affect the harmonic measurement accuracy negatively.

Due to the possible presence of folding distortion and the fact that harmonics is measured sequentially, one at a time, it is recommended that the harmonic measurement results of the meter is used as a tool to detect presence of harmonics and not as an exact instrument to get exact results.

Frequency measurement measurement is uncertain, the harmonic measurement will not be performed. To get a valid measurement the meter uses a retry scheme. If the retry scheme does not give a valid measurement the harmonic will be marked as "not available".

## Accuracy

The accuracy of the current harmonics varies with the harmonic amplitude and is valid only provided there is no harmonics above the 16th harmonic.

| Harmonic Number | 1\% < <br> Distortion $\leq$ 5\% | 5\% < <br> Distortion $\leq$ 10\% | $10 \%$ < <br> Distortion $\leq$ $20 \%$ | 20\% < <br> Distortion $\leq$ 50\% | 50\% < <br> Distortion $\leq$ 100\% |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 2 | $\pm 0.5 \%$ * | $\pm 1.0$ | $\pm 2 \%$ | $\pm 4 \%$ | $\pm 6 \%$ |
| 3 | $\pm 0.7 \%$ * | $\pm 1.5 \%$ | $\pm 3 \%$ | $\pm 6 \%$ | $\pm 9 \%$ |
| 4 | $\pm 1.0 \%$ | $\pm 2.0 \%$ | $\pm 4 \%$ | $\pm 8 \%$ | $\pm 12 \%$ |
| 5 | $\pm 1.2 \%$ | $\pm 2.5 \%$ | $\pm 5 \%$ | $\pm 10 \%$ | $\pm 15 \%$ |
| 6 | $\pm 1.5 \%$ | $\pm 3.0 \%$ | $\pm 6 \%$ | $\pm 12 \%$ | $\pm 18 \%$ |
| 7 | $\pm 1.7 \%$ | $\pm 3.5 \%$ | $\pm 7 \%$ | $\pm 14 \%$ | $\pm 21 \%$ |
| 8 | $\pm 2.0 \%$ | $\pm 4.0 \%$ | $\pm 8 \%$ | $\pm 16 \%$ | $\pm 24 \%$ |
| 9 | $\pm 2.5 \%$ | $\pm 5.0 \%$ | $\pm 10 \%$ | $\pm 20 \%$ | $\pm 30 \%$ |
| 10 | $\pm 2.5 \%$ | $\pm 5.0 \%$ | $\pm 10 \%$ | $\pm 20 \%$ | $\pm 30 \%$ |
| 11 | $\pm 2.5 \%$ | $\pm 5.0 \%$ | $\pm 10 \%$ | $\pm 20 \%$ | $\pm 30 \%$ |
| 12 | $\pm 2.5 \%$ | $\pm 5.0 \%$ | $\pm 10 \%$ | $\pm 20 \%$ | $\pm 30 \%$ |
| 13 | $\pm 2.5 \%$ | $\pm 5.0 \%$ | $\pm 10 \%$ | $\pm 20 \%$ | $\pm 30 \%$ |
| 14 | $\pm 2.5 \%$ | $\pm 5.0 \%$ | $\pm 10 \%$ | $\pm 20 \%$ | $\pm 30 \%$ |
| 15 | $\pm 2.5 \%$ | $\pm 5.0 \%$ | $\pm 10 \%$ | $\pm 20 \%$ | $\pm 30 \%$ |
| 16 | $\pm 2.5 \%$ | $\pm 5.0 \%$ | $\pm 10 \%$ | $\pm 20 \%$ | $\pm 30 \%$ |

* For distortion levels below $1 \%$ the absolute uncertainty is $\pm 0.5 \%$.

### 5.4 Alarm

## General

Quantities

The purpose of the alarm function is to enable monitoring of quantities in the meter. Monitoring can be set to high or low level detection. High level detection gives an alarm when the level of a quantity goes above the set level. Low level detection gives an alarm when the value goes below the set level.
It is possible to configure 25 alarms. Configuration can be done via communication or with the buttons directly on the meter.

Depending on the meter type all or a subset of the following quantities can be monitored:

| Voltage L1 | Reactive power L2 |
| :--- | :--- |
| Voltage L2 | Reactive power L3 |
| Voltage L3 | Apparent power total |
| Voltage L1-L2 | Apparent power L1 |
| Voltage L2-L3 | Apparent power L2 |
| Voltage L1-L3 | Apparent power L3 |
| Current L1 | Power factor total |
| Current L2 | power factor L1 |
| Current L3 | Power factor L2 |
| Current N | power factor L3 |
| Active power total | Harmonic voltage L1 |
| Active power L1 | Harmonic voltage L2 |
| Active power L2 | Harmonic voltage L3 |
| Active power L3 | Harmonic voltage L1-L2 |
| Reactive power Total | Harmonic voltage L2-L3 |
| Reactive power L1 | Harmonic voltage L1-L3 |

## Functional description

When the value of the monitored quantity passes the activation level, and remains there for a period of time equal or longer than the specified time delay, the alarm is activated. In the same way, the alarm is deactivated when the value passes the deactivation level and remains there for a time equal or longer than the specified time delay.

If the activation level is higher than the deactivation level, the alarm is activated when the value of the monitored quantity is higher than the activation level.
If the activation level is lower than the deactivation level, the alarm is activated when the vale of the monitored quantity is lower than the activation level.

### 5.5 Inputs and Outputs

## General Inputs/outputs are built with autocouplers and are galvanically isolated from other

 meter electronics. They are polarity independent and handle both DC and AC voltage.An input that is not connected equals having its voltage off.
The equivalent circuitry of the outputs is an ideal relay in series with a resistor.

## Functionality of inputs

The inputs count pulses, register activity and current status and the data can be read directly on the meter display or via communication

Register activity can be reset via communication or via the buttons directly on the meter.

Functionality of The outputs can be controlled by communication, alarm or by the internal clock. outputs

### 5.5.1 Tariff Inputs

## Tariff control

## Indication of active tariff

On meters with tariff functionality, the tariffs are controlled either via communication, the internal clock or by 1 or 2 tariff inputs.

Tariff control via inputs is done by applying a proper combination of "voltage" or "no voltage" to the input(s). Each combination of "voltage"/"no voltage" will result in that the meter will register the energy in a particular tariff register.

In combined meters with both active and reactive metering, both quantities are controlled by the same inputs and the active tariff for active and reactive energy will always be the same.

The active tariff is displayed on the LCD by the text "Tx" in the status field, where $x$ is the tariff number. The active tariff can also be read via communication.

## Input coding, meters with 4 tariffs

The coding of the inputs is binary. The following table describes the default coding.

| Input 4 | Input 3 | Tariff |
| :--- | :--- | :--- |
| OFF | OFF | $=\mathrm{T} 1$ |
| OFF | ON | $=\mathrm{T} 2$ |
| ON | OFF | $=\mathrm{T} 3$ |
| ON | ON | $=\mathrm{T} 4$ |

## Input coding, meters with 2 tariffs

The coding of the inputs is binary. The following table describes the default coding.

| Input 3 | Tariff |
| :--- | :--- |
| OFF | $=\mathrm{T} 1$ |
| ON | $=\mathrm{T} 2$ |

### 5.5.2 Pulse Outputs

## About pulse outputs

Meters equipped with pulse outputs may have up to 4 outputs.
On the pulse outputs the meter sends out a specified number of pulses (pulse frequency) per kilowatt hour (kilovar for reactive pulse outputs).
The pulse outputs are primary, which means that the pulses are sent out in proportion to the true primary energy, taking current and voltage transformer ratios (CT and VT ratio) programmed on the meter into account.

For direct connected meters no external transformers are used and the amount of pulses sent out are in proportion to the energy flowed through the meter.

### 5.5.2.1 Pulse Frequency and Pulse length

General Pulse frequency and pulse length can be set via the buttons on the meter or via communication. If the meter have more than 1 pulse output, all outputs will have the same pulse frequency and pulse length.

Pulse frequency The pulse frequency is configurable and can be set to a value between 1-9999 impulses. The value must be an integer. The unit is selectable and may be set to $\mathrm{imp} / \mathrm{kWh}, \mathrm{imp} / \mathrm{Wh}$ or imp/MWh.

Pulse length The pulse length can be set to a value between $10-990 \mathrm{~ms}$.

## Deciding pulse frequency/length

If the power is too high for a certain pulse length and pulse frequency, there is a risk that the pulses may go into one another. If this happens the meter will emit a new pulse (relay closed) before the previous one has terminated (relay open) and the pulse will be missed. In worst case the relay may be closed at all times.

To avoid this problem a calculation should be made to work out the maximum pulse frequency allowed at a particular site based upon an estimated maximum power and the meter's pulse output data.

## Formula

The formula to use for this calculation is:
Max pulse frequency $=1000 * 3600 / U / I / n /($ Pause + Plength $)$
where $U$ and $I$ is the estimated maximum element voltage (in volts) and current (in amperes), $n$ the number of elements ( $1-3$ ). Plength and Pause are the pulse length and the required pulse pause (in seconds). A reasonable minimum pulse length and pulse pause is 30 ms which conforms to the S 0 and IEC standard.

Note - U and I have to be the primary values in a transformer connected meter if the CT and VT for the external transformers are programmed into the meter.

## Example 1

## Example 2

In a direct connected 3-element meter with estimated maximum voltage and current of 250 V and 65 A and pulse length 100 ms and required pulse pause 30 ms , the maximum allowed pulse frequency will be:

$$
1000 * 3600 / 250 / 65 / 3 /(0.030+0.100))=568 \text { impulses } / \mathrm{kWh}(\mathrm{kvarh})
$$

In a transformer connected 3-element meter with estimated maximum voltage and current of $63 * 100 \mathrm{~V}=6300 \mathrm{~V}$ (VT ratio 100) and $6 * 50 \mathrm{~A}=300 \mathrm{~A}$ (CT ratio 50) and pulse width 100 ms and required pulse pause 30 ms the maximum allowed pulse frequency will be:
$1000 * 3600 / 6300 / 300 / 3 /(0.030+0.100)=6.16$ impulses $/ k W h(k v a r h)$

### 5.6 Internal Clock

## General

## Time and date

Time dependant functions

Meter with a built-in clock automatically keeps track of leap year and daylight savings time (DST). The use of DST is optional.Time is controlled by a quartz crystal real time clock.

Time and date can be set via communication, or with the buttons directly on the meter.

- Load profile
- Maximum demand
- Minimum demand
- Previous values
- Event log
- Outputs controlled by time
- Tariff control

In case of power failure a super capacitor backs up the clock for 48 hours.

### 5.7 Logs

## General <br> The meter contains a total of five different logs:

- System Log
- Event Log
- Net Quality Log
- Audit log
- Settings Log

Log events can be read via communication or directly in the display of the meter.
A maximum of 500 log events can be stored in the System Log, the Event Log and the Net Quality Log. When the maximum number of events for a $\log$ is reached, the oldest events will be overwritten.
A maximum of $40 \log$ events can be stored in the Audit Log. When the maximum number of events for this log is reached, no more events can be stored. A new firmware upgrade attempt will be unsuccessful because no more log events can be stored.

A maximum of 80 log events can be stored in the Settings Log. When the maximum number of events for this $\log$ is reached, no more events can be stored. A new setting for either CT/VT or number of elements will not be accepted because no more $\log$ events can be stored.

It is possible to delete all entries in the System Log, The Event Log and the Net Quality Logvia communication.

### 5.7.1 System Log

This $\log$ stores events that relate to errors in the meter.

## Contents

The following information is stored in an event:

- Date and time
- Event Code
- Duration

The following events are stored in this log:

- Program CRC Error - Error when checking firmware consistency.
- Persistent Storage Error - Data stored in long-term memory is corrupt.
- RTC Circuit Error - Error when trying to read date and time from real-time clock.

### 5.7.2 Event Log

This $\log$ stores events that relate to alarms and configuration warnings.

## Contents The following information is stored in an event:

- Date and Time
- Event Code
- Duration

The following events are stored in this log:

- Date Not Set Warning - Date has not been configured for RTC.
- Time Not Set Warning - Time has not been configured for RTC.
- Negative Power Element 1 Warning - Element 1 measures negative power.
- Negative Power Element 2 Warning - Element 2 measures negative power.
- Negative Power Element 3 Warning - Element 3 measures negative power.
- Negative Total Power Warning - Total power is measured as negative.
- Alarm Current L1
- Alarm current L2
- Alarm Current L3
- Alarm Current Neutral
- Alarm Active Power Total
- Alarm Active Power L1
- Alarm Active Power L2
- Alarm Active Power L3
- Alarm Reactive Power total
- Alarm Reactive Power L1
- Alarm Reactive Power L2
- Alarm Reactive Power L3
- Alarm Apparent power Total
- Alarm Apparent power L1
- Alarm Apparent power L2
- Alarm Apparent power L3
- Alarm Power Factor Total
- Alarm Power Factor L1
- Alarm Power Factor L2
- Alarm Power Factor L3

### 5.7.3 Net Quality Log

This log stores alarms and information that relates to net quality.

## Contents

The following events are stored in this log

- U1 Missing Warning - U1 is missing
- U2 Missing Warning - U2 is missing
- U3 Missing Warning - U3 is missing
- Frequency Warning - Net frequency is not stable
- Alarm Voltage L1
- Alarm Voltage L2
- Alarm Voltage L3
- Alarm Voltage L1-L2
- Alarm Voltage L2-L3
- Alarm Voltage L1-L3
- Alarm Harmonic Voltage L1
- Alarm Harmonic Voltage L2
- Alarm Harmonic Voltage L3
- Alarm Harmonic Voltage L1-L2
- Alarm Harmonic Voltage L2-L3
- Alarm Harmonic Voltage L1-L3

### 5.7.4 Audit Log

The Audit Log stores an event after an attempt has been made to upgrade the firmware.

## Contents

The following information is stored in an event:

- Date and Time
- Firmware version
- Active Energy import
- Active Energy import L1
- Active Energy import L2
- Active Energy import L3
- Active Energy import Tariff 1
- Active Energy import Tariff 2
- Active Energy import Tariff 3
- Active Energy import Tariff 4
- Active Energy Export
- Firmware Upgrade status

### 5.7.5 Settings Log

This $\log$ stores an event when the transformer ratio is reconfigured.

Contents The following information is stored in an event:

- Date and Time
- Firmware version
- Active Energy import
- Active Energy import L1
- Active Energy import L2
- Active Energy import L3
- Active Energy import Tariff 1
- Active Energy import Tariff 2
- Active Energy import Tariff 3
- Active Energy import Tariff 4
- Active Energy Export
- CT-Value
- VT-Value
- Elements

### 5.7.6 Event codes

## Description

The following table describes the event codes that may ocurr in the System log, the Event log and the Net quality log:

| Event code | Event |
| :--- | :--- |
| 41 | Program CRC error |
| 42 | Persistent storage error |
| 53 | RTC circuit error |
| 1000 | U1 Missing Warning |
| 1001 | U2 Missing Warning |
| 1002 | U3 Missing Warning |
| 1004 | Negative Power Element 1 Warning |
| 1005 | Negative Power Element 2 Warning |
| 1006 | Negative Power Element 3 Warning |
| 1007 | Negative Total power Warning |
| 1008 | Frequency Warning |
| 1010 | Date Not Set Warning |
| 1011 | Time Not Set Warning |
| 2013 | Alarm 1 active |
| 2014 | Alarm 2 active |

| Event code | Event |
| :--- | :--- |
| 2015 | Alarm 3 active |
| 2016 | Alarm 4 active |
| 2017 | Alarm 5 active |
| 2018 | Alarm 6 active |
| 2019 | Alarm 7 active |
| 2020 | Alarm 8 active |
| 2021 | Alarm 9 active |
| 2022 | Alarm 10 active |
| 2023 | Alarm 11 active |
| 2024 | Alarm 12 active |
| 2025 | Alarm 13 active |
| 2026 | Alarm 14 active |
| 2027 | Alarm 15 active |
| 2028 | Alarm 16 active |
| 2029 | Alarm 17 active |
| 2030 | Alarm 18 active |
| 2031 | Alarm 19 active |
| 2032 | Alarm 20 active |
| 2033 | Alarm 21 active |
| 2034 | Alarm 22 active |
| 2035 | Alarm 23 active |
| 2036 | Alarm 24 active |
| 2037 | Alarm 25 active |
|  |  |

### 5.8 Demand

## General

## Storing periods

The demand functionality is used to measure and store the maximum and minimum demands of different quantities in the meter. Time is divided into intervals of a certain length in which the mean values of a set of selected quantities are measured.

Demand can be configured via communication or via the buttons on the meter.
Note - Before any demand values can be stored, time/date must be set.
Changing time/ date will store the current period and start a new one.
If a power fail occurs that lasts over the end of an ongoing period, the period will be stored when the meter powers up again and a new period will start. If date/time is not set when the meter powers up again, demand will enter a waiting state until time/date is set.

The interval lengths for demand can be one of the following: $1,2,5,10,15,20$, $30,60,120,180,240,360,480,720$ or 1440 minutes.

When the last interval of an ongoing period has finished, the maximum- and/or minimum values are stored and a new period starts.

The length of a demand period can be a day, a week or a month.
Demand has 50 channels which can be configured individually. Each channel can store up to 200 periods. A stored period contains the demand value, the date/time of the period and the date/time of the interval when the demand value was measure. All channels use the same interval and period length.
The period/interval date and time is stored as end of period/interval. For instance, if a period starts 2010.01.0100:00.00 and ends 2010.01.02 00:00.00, then the stored period will be 2010.01.02 00:00.00.
If there is no free memory space available, the oldest period will be erased to make room for the most recent one.

Stored periods can be read via communication or directly on the display.
An ongoing period can be ended and a new one started by sending a "freeze demand" via communication.

It is also possible to erase all stored periods by sending a "Reset Demand" command via communication.

The number of demand values to be stored during a period is individually configurable per channel. Each demand channel can be configured to store up to the three highest or lowest demand values. If demand is configured to store only one maximum interval, then only the interval with the maximum peak will be re-
corded. If demand is configured to store three maximum intervals the intervals with the three highest peaks are recorded.

Sliding demand

Selectable quantities

A demand channel can also be configured as maximum sliding demand or minimum sliding demand. A sub-interval time is set which divides the interval into a circular array with a new mean value calculated at the end of every sub-interval. The selectable sub-interval times for demand is a subset of the interval times and evenly divisible with the selected interval time.

Depending on the meter type all or a subset of the following quantities can be selected.

| ACTIVE ENERGY IMPORT TOTAL | HARMONIC VOLTAGE L1* |
| :--- | :--- |
| ACTIVE ENERGY IMPORT L1 | HARMONIC VOLTAGE L2* |
| ACTIVE ENERGY IMPORT L2 | HARMONIC VOLTAGE L3* |
| ACTIVE ENERGY IMPORT L3 | HARMONIC VOLTAGE L1-L2* |
| REACTIVE ENERGY IMPORT TOTAL | HARMONIC VOLTAGE L2-L3* |
| REACTIVE ENERGY IMPORT L1 | HARMONIC VOLTAGE L1-L3* |
| REACTIVE ENERGY IMPORT L2 | CURRENT L1* |
| REACTIVE ENERGY IMPORT L3 | CURRENT L2* |
| APPARENT ENERGY IMPORT TOTAL | CURRENT L3* |
| APPARENT ENERGY IMPORT L1 | HARMONIC CURRENT L1* |
| APPARENT ENERGY IMPORT L2 | HARMONIC CURRENT L2* |
| APPARENT ENERGY IMPORT L3 | HARMONIC CURRENT L3* |
| ACTIVE ENERGY IMPORT TARIFF1 | ACTIVE POWER TOTAL** |
| ACTIVE ENERGY IMPORT TARIFF2 | HARMONIC CURRENT NEUTRAL* |
| ACTIVE ENERGY IMPORT TARIFF3 | ACTIVE POWER L1* |
| ACTIVE ENERGY IMPORT TARIFF4 | ACTIVE POWER L2* |
| REACTIVE ENERGY IMPORT TARIFF1 | ACTIVE POWER L3* |
| REACTIVE ENERGY IMPORT TARIFF2 | REACTIVE POWER TOTAL* |
| REACTIVE ENERGY IMPORT TARIFF3 | REACTIVE POWER L1* |
| REACTIVE ENERGY IMPORT TARIFF4 | REACTIVE POWER L2* |
| VOLTAGE L1* | REACTIVE POWER L3* |
| VOLTAGE L2* | APPARENT POWER TOTAL* |
| VOLTAGE L3* | APPARENT POWER L1* |
| VOLTAGE L1-L2* | APPARENT POWER L2* |
| VOLTAGE L2-L3* | APPARENT POWER L3* |
| VOLTAGE L1-L3* | PULSE INPUT COUNTERS |

[^0]
### 5.9 Previous Values

## General

At the and of a defined period, up to 50 configurable channels, which can contain energy register values, input counter values and currency $/ \mathrm{CO}_{2}$ values, are stored together with the current time/date

Previous values can be configured via communication or via the buttons on the meter.

Note - Before any previous values can be stored, time/date must be set.
Changing time/ date will store the current period and start a new one.
If a power fail occurs that lasts over the end of an ongoing period, the period will be stored when the meter powers up again and a new period will start. If date/time is not set when the meter powers up again, previous values will enter a waiting state until time/date is set.

## Storing periods

Selectable quantities

Depending on the meter type all or a subset of the following quantities can be selected.

| ACTIV ENERGY IMPORT TOTAL | ACTIVE ENERGY IMPORT TARIFF3 |
| :--- | :--- |
| ACTIVE ENERGY EXPORT TOTAL | ACTIVE ENERGY IMPORT TARIFF4 |
| ACTIVE ENERGY IMPORT L1 | REACTIVE ENERGY IMPORT TARIFF |
| ACTIVE ENERGY IMPORT L2 | REACTIVE ENERGY IMPORT TARIFF2 |

### 5.10 Load Profile

## General

## Intervals

## Example 1

## Example 2

## Channels and

 snapshotsA load profile is a collection of 8 channels that can store register values. Through communication each channel can be assigned one register, a time interval and a minimum amount of snapshots to be stored in the channel.

Interval per channel can also be configured via the buttons on the meter.
The load profiles can be read via communication or directly on the display.
The stored register values in a channel can be read either as a list of snapshots or as interval consumptions.

Note - Before any load profiles can be stored, time/date must be set.

If a power failure occurs toward the end of an interval, the event will be stored when the meter powers up again only if time/date are still correct.

The interval lengths for Load Profiles can be one of the following: $1,2,5,10,15$, $20,30,60,120,180,240,360,480,720$ or 1440 minutes.

If the interval is evenly divisible with an hour, the start of each hour will mark the start of a new interval. If the interval is evenly divisible with a day, the start of a day will mark the start of a new interval.

The interval date and time is stored as end of interval. For instance, if an interval starts 2010.01.01 00:00.00 and ends 2010.01.01 00:15.00, then the stored period will be 2010.01.01 00:15.00.

Interval is set to 120 minutes, current time 12:13. Evenly divisible with a day. The next interval end/start times will be: 14:00, 16:00, 18:00, 20:00, 22:00, 00:00, etc,...

Interval is set to 15 minutes, current time 12:13. Evenly divisible with an hour. The next interval end/start times will be: 12:15, 12:30, $12: 45,13: 00,13.15,13.30$ etc,...

Each channel has its own interval configuration. That means that snapshots in one channel can be stored with a different interval than snapshots in another channel.

Each channel can be assigned a number of snapshots. A total of 40000 snapshots can be stored in a load profile. All channels in a load profile share the same memory area, which means that one channel can store 40000 snapshots if no other
channel is used. By default the meter has all 8 channels activated with 5000 snapshots assigned to each.

If there is no free memory space available, the oldest snapshot will be erased to make room for the most recent one.

It is possible to erase all snapshots per channel by sending a "Reset Load profile" command via communication.

Reading
snapshots

There are two ways of reading out the snapshots:

- Smart search automatically ignores all duplicate snapshots that may have been stored if time/date has been changed backwards.
- Raw search outputs all snapshots that are stored in memory, including any duplicate.

By default, the search type is set to smart search. The search type can be configured via communication.

## Load profile data

Each load profile data value is associated with a status value. The status value gives information such as:

- Interval is longer or shorter than defined length
- Power outage occurred during interval
- Data not available

## Selectable quantities

Depending on the meter type all or a subset of the following quantities can be selected:

| ACTIVE ENERGY IMPORT TOTAL | APPARENT ENERGY IMPORT L3 |
| :--- | :--- |
| ACTIVE ENERGY EXPORT TOTAL | APPARENT ENERGY EXPORT L1 |
| ACTIVE ENERGY IMPORT L1 | APPARENT ENERGY EXPORT L2 |
| ACTIVE ENERGY IMPORT L2 | APPARENT ENERGY EXPORT L3 |
| ACTIVE ENERGY IMPORT L3 | ACTIVE ENERGY CURRENCY CONVER- <br> SION |
| ACTIVE ENERGY EXPORT L1 | ACTIVE ENERGY CO2 CONVERSION |
| ACTIVE ENERGY EXPORT L2 | VOLTAGE L1* |
| ACTIVE ENERGY EXPORT L3 | VOLTAGE L2* |
| REACTIVE ENERGY IMPORT TOTAL | VOLTAGE L3* |
| REACTIVE ENERGY EXPORT TOTAL | VOLTAGE L1-L2* |
| REACTIVE ENERGY IMPORT L1 | VOLTAGE L2-L3* |
| REACTIVE ENERGY IMPORT L2 | VOLTAGE L1-L3* |
| REACTIVE ENERGY IMPORT L3 | CURRENT L1* |
| REACTIVE ENERGY EXPORT L1 | CURRENT L2* |
| REACTIVE ENERGY EXPORT L2 | CURRENT L3* |
| REACTIVE ENERGY EXPORT L3 | CURRENT Neutral |
| APPARENT ENERGY IMPORT TOTAL | POWER FACTOR TOTAL* |
| APPARENT ENERGY EXPORT TOTAL | POWER FACTOR L1* |
| APPARENT ENERGY IMPORT L1 | POWER FACTOR L2* |
| APPARENT ENERGY IMPORT L2 | POWER FACTOR L3* |

The value is a mean value of the period.

## Chapter 6: Technical data

Overview
This chapter containstechnical data and product drawings.

In this chapter The following topics are covered in this chapter:
6.1 Technical Specifications
72
6.2 Physicalsical dimensions ................................................................... 76

### 6.1 Technical Specifications

## Specifications for A 41 direct connected meters

| Voltage/current inputs |  |
| :---: | :---: |
| Nominal voltage | 230 VAC |
| Voltage range | 57.7-288 VAC (-20\%-+15\%) |
| Power dissipation voltage circuits | 0.8 VA (0.8 W) total |
| Power dissipation current circuits | $0.007 \mathrm{VA}(0.007 \mathrm{~W})$ at 230 VAC and $\mathrm{I}_{\text {ref }}$ |
| Base current $\mathrm{l}_{\mathrm{b}}$ | 5 A |
| Reference current $\mathrm{I}_{\text {ref }}$ | 5 A |
| Transitional current $\mathrm{Itr}^{\text {dr }}$ | 0.5 A |
| Maximum current $\mathrm{I}_{\max }$ | 80 A |
| Minimum current $I_{\text {min }}$ | 0.25 A |
| Starting current $\mathrm{I}_{\mathrm{st}}$ | $<20 \mathrm{~mA}$ |
| Terminal wire area | $1-25 \mathrm{~mm}^{2}$ |
| Recommended tightening torque | 2.5 Nm |
| General data |  |
| Frequency | 50 or $60 \mathrm{~Hz} \pm 5 \%$ |
| Accuracy | 1\% |
| Display | $96 \times 64$ pixels, view area $39 \times 26 \mathrm{~mm}$ |
| Mechanical |  |
| Material | Polycarbonate in transparent front glass, bottom case, upper case and terminal cover. Glass reinforced polycarbonate in terminal block. |
| Weight |  |
| Environmental |  |
| Operating temperature | $-40^{\circ} \mathrm{C}-+70^{\circ} \mathrm{C}$ |
| Storage temperature | $-40^{\circ} \mathrm{C}-+85^{\circ} \mathrm{C}$ |
| Humidity | $75 \%$ yearly average, 95\% on 30 days/year. |
| Resistance to fire and heat | Terminal $960^{\circ} \mathrm{C}$, cover $650^{\circ} \mathrm{C}$ (IEC 60695-2-1) |
| Resistance to water and dust | IP 20 on terminal block without protective enclosure and IP 51 in protective enclosure, according to IEC 60529. |
| Mechanical environment | Class M1 in accordance with the Measuring Instrument Directive (MID), (2004/22/EC). |
| Electromagnetic environment | Class E2 in accordance with the Measuring Instrument Directive (MID), (2004/22/EC). |
| Outputs |  |
| Current | 2-100 mA |
| Voltage | 24 VAC - 240 VAC, 24 VDC - 240 VDC. For meters with only 1 output, 5 -40VDC. |
| Pulse output frequency | Prog. 1-9999 imp/MWh, 1-9999 imp/kWh, 1-9999 imp/Wh |
| Pulse length | $10-990 \mathrm{~ms}$ |
| Terminal wire area | 0.5-1 mm ${ }^{\text {2 }}$ |

| Recommended tightening torque | 0.25 Nm |
| :---: | :---: |
| Inputs |  |
| Voltage | 0-240 V AC/DC |
| OFF | 0-20 V AC/DC |
| ON | 45-240 V AC/DC |
| Min. pulse length | 30 ms |
| terminal wire area | 0.5-1 mm ${ }^{2}$ |
| Recommended tightening torque | 0.25 Nm |
| Communication |  |
| Terminal wire area | 0.5-1 mm ${ }^{2}$ |
| Recommended tightening torque | 0.25 Nm |
| Pulse indicator(LED) |  |
| Pulse frequency | $1000 \mathrm{imp} / \mathrm{kWh}$ |
| Pulse length | 40 ms |
| EMC compatibility |  |
| Impulse voltage test | $6 \mathrm{kV} \mathrm{1.2/50} \mathrm{\mu s} \mathrm{(IEC} \mathrm{60060-1)}$ |
| Surge voltage test | $4 \mathrm{kV} \mathrm{1.2/50} \mathrm{\mu s} \mathrm{(IEC} \mathrm{61000-4-5)}$ |
| Fast transient burn test | 4 kV ( IEC 61000-4-4 ) |
| Immunity to electromagnetic HF-fields | $80 \mathrm{MHz}-2 \mathrm{GHz}$ at $10 \mathrm{~V} / \mathrm{m}$ (IEC61000-4-3) |
| Immunity to conducted disturbance | 150 kHz - 80MHz, ( IEC 61000-4-6 ) |
| Immunity to electromagnetic disturbances | 2-150 kHz for kWh-meters |
| Radio frequency emission | EN 55022, class B (CISPR22) |
| Electrostatic discharge | 15 kV ( IEC 61000-4-2 ) |
| Standards | IEC 62052-11, IEC 62053-21 class 1 \& 2, IEC 62053-23 class 2, IEC 62054-21, GB/T 17215.211-2006, GBT 17215.3212008 class 1 \& 2, GB 4208-2008, EN 50470-1, EN 50470-3 category A \& B |

## Specifications for A 42 transformer rated meter

| Voltage inputs |  |
| :--- | :--- |
| Nominal voltage | 230 VAC |
| Voltage range | $57,7-288 \mathrm{VAC}(-20 \%-+15 \%)$ |
| Power dissipation voltage circuits | $0.8 \mathrm{VA}(0.8 \mathrm{~W})$ total |
| Power dissipation current circuits | $0.001 \mathrm{VA}(0.001 \mathrm{~W})$ at 230 VAC and $\mathrm{I}_{\text {ref }}$ |
| Terminal wire area | $0.5-10 \mathrm{~mm}^{2}$ |
| Recommended tightening torque | 2 Nm |
| Current inputs |  |
| Rated current $\mathrm{I}_{\mathrm{n}}$ | 1 A |
| Reference current $\mathrm{I}_{\text {ref }}$ | 1 A |
| Transitional current $\mathrm{I}_{\mathrm{tr}}$ | 0.05 A |
| Maximum current $\mathrm{I}_{\max }$ | 6 A |

| Minimum current $\mathrm{I}_{\text {min }}$ | 0.02 A |
| :---: | :---: |
| Starting current $\mathrm{I}_{\text {st }}$ | $<1 \mathrm{~mA}$ |
| Terminal wire area | 0.5-10mm |
| Recommended tightening torque | 2 Nm |
| General data |  |
| Frequency | 50 or $60 \mathrm{~Hz} \pm 5 \%$ or $16,7 \mathrm{~Hz}$ (optional) |
| Accuracy | 0.5\%, 1\% |
| Display | 96x64 pixels, view area $39 \times 26 \mathrm{~mm}$ |
| Mechanical |  |
| Material | Polycarbonate in transparent front glass, bottom case, upper case and terminal cover. Glass reinforced polycarbonate in terminal block. |
| Weight |  |
| Environmental |  |
| Operating temperature | $-40^{\circ} \mathrm{C}-70^{\circ} \mathrm{C}$ |
| Storage temperature | $-40^{\circ} \mathrm{C}-85^{\circ} \mathrm{C}$ |
| Humidity | 75\% yearly average, $95 \%$ on 30 days/year |
| Resistance to fire and heat | Terminal $960^{\circ} \mathrm{C}$, cover $650^{\circ} \mathrm{C}$ (IEC 60695-2-1) |
| Resistance to water and dust | IP 20 on terminal block without protective enclosure and IP 51 in protective enclosure, according to IEC 60529. |
| Mechanical environment | Class M1 in accordance with the Measuring Instrument Directive (MID), (2004/22/EC). |
| Electromagnetic environment | Class E2 in accordance with the Measuring Instrument Directive (MID), (2004/22/EC). |
| Outputs |  |
| Current | 2-100 mA |

### 6.2 Physicalsical dimensions

A41/A42
The following drawing shows the physical dimensions of the A41/A42 meters.

## Chapter 7: Measurement Methods

Overview<br>This chapter contains information about measurement theory and the most commonly used measurement methods. The information can be used to better understand the meter behavior and/or to pick the correct measurement method.

In this chapter The following topics are covered in this chapter:
7.1 Measuring Energy ..... 80
7.1.1 Single Phase, 1-Element Metering ..... 82
7.1.2 3-Phase, 2-Element Metering ..... 84
7.1.3 3-Phase, 3-Element Metering ..... 86

### 7.1 Measuring Energy

## Active energy

It is easy to understand the need for a utility to measure active energy, since the information is neccesary to bill the customer correctly. Usually the more energy the customer consumes the higher the accuracy of the meter needs to be. Normally 4 accuracy classes are used: $2 \%$ - (small consumers, e.g. households), $1 \%-, 0.5 \%-$ and $0.2 \%$-meters with defined power levels for each class.

Also from a customer point of view it is easy to understand the need to measure the active energy as it can give him information about where and when energy is consumed. This information can then be used to take measures to decrease the consumption.

In many cases it is desired to simplify the measurement. Insuch cases simplified methods can be used of which the most common are described in this chapter. These methods most often require a balanced load, which means that the impedance is the same in all phases giving the same current amplitude and power factor in all phases.

Note - It should be mentioned that even if the load is perfectly balanced the accuracy will be decreased if the incoming voltages are not the same on all phases.

Reactive energy Sometimes there is also a need to measure the reactive energy. Consumer equipment often introduces a phase shift between current and voltage due to the fact that the load has a more or less reactive component, e.g. motors that have an inductive component, etc. A reactive load will increase the current which means that the power source generator and the size of the power lines have to increase which in turn means higher cost for the utility. A higher current also means that the line losses increase.

Because of that, the maximum permissible phase shift is sometimes governed in the terms of the contract that the consumer have with the power supplier. If the consumer exceeds a specified maximum reactive load, he will be liable for an extra charge. This type of contract will require a utility meter that measures reacfive energy and/or power.

Also, from the customer's point of view, it may be of some interest to measure reactive energy/power since it gives him knowledge about the nature of the load. That is, how big the different loads are and how they vary over time. This knowledge can be used in the planning how to decrease the reactive power/energy to decrease the electricity bill.

## Resistive, inductive and capacitive loads

Resistive loads don't give rise to any phase shifts. Inductive loads have phase shift in one direction with the current lagging the voltage, while capacitive loads produces a phase shift in the opposite direction with the current leading the voltage. As a result, inductive and capacitive loads can be used to compensate each other

## Illustration

## Phase displacement

## Illustration

The 4 power quadrants

The following illustration shows a vector diagram for resistive, inductive and capacitive loads:

A load that consumes both reactive and active energy can be divided into active and reactive components. The angle between the apparent power ( $\mathrm{U}^{*} \mathrm{I}$ ) vector and the active power component is described as phase displacement angle or power factor angle, often referred to as $\varphi \cdot \operatorname{Cos} \varphi$ is referred to as the power factor.

The following illustration shows a vector diagram for a load with an active and a reactive component:

| Active power $=\mathrm{P}=\mathrm{U} \times \mathrm{I} \times \cos \uparrow$ (unit W ) |
| :---: |
| Reactive power $=\mathrm{Q}=\mathrm{U} \times \mathrm{I} \times \sin \varsigma$ (unit var) |
| Apparent power $=\mathrm{S}=\mathrm{U} \times \mathrm{I}$ (unit VA) |
| Reactive power |
| Apparent |
| power |
| Active |
| power |

The type of load can be represented geometrically by for quadrants. In the first quadrant the load is inductive and active and energy is imported (energy is delivered from the utility to the customer). In the second quadrant the load is capacitive and active energy is exported and reactive energy is imported. In the third quadrant the load is inductive and active and reactive energy is exported. In the last quadrant the load is capacitive and active energy is imported and reactive energy exported.

## Illustration

The following illustration shows the loads

### 7.1.1 Single Phase, 1-Element Metering

## 1- element metering in a 2-wire system

In a 2-wire installation a single phase meter is used. Normally the 2 wires are a phase voltage and the neutral.
The active energy consumed by the load is the product of momentary voltage and current integrated over the desired measuring time period.

## Calculating active power

In the case where no harmonics is present and the rms value of the voltage and current is constant, the active power can be expressed as:
$\mathrm{P}=\mathrm{U}_{\mathrm{rms}} * \mathrm{I}_{\mathrm{rms}} * \cos \varphi$
where $\varphi$ is the phase angle between the voltage and the current.

## Illustration

The following illustration shows a direct connected single phase meter measuring the active energy (E) consumed by a load.

## 1element metering in a 4-wire system

In 4-wire system the single element metering method only gives correct results in a balanced system (same voltage, current and power factor in all phases). This method should not be used for accurate measurement, but can be used when high accuracy is not needed.

## Illustration

The following illustration shows single phase metering in a 3-phase system.

### 7.1.2 3-Phase, 2-Element Metering

## 2element metering in a 3-wire system

The 2-element metering method is used in systems with 3 wires, normally a 3phase system that does not have a neutral conductor. A 2-element meter can be used irrespectively of the load being balanced or not.

In a 2-element meter the L2 voltage is used as the voltage reference and the voltage difference between that voltage and the L1 and L3 voltage are measured and multiplied by its respective current. The active energy consumed by the load is the product of momentary voltages U1-U2 and U3-U2 and the currents I1 and I2 integrated over the desired measuring time period.

## Illustration

The following diagram shows a 2-element meter measuring the active energy (E) consumed by a load.

## Calculating total active power

If no harmonics is present and the rms values of the voltages and currents are constant, the total active power can be expressed as:

Ptot $=\mathrm{P} 1+\mathrm{P} 3=(\mathrm{U} 1-\mathrm{U} 2) \times \mathrm{I} 1 \mathrm{c} \cos \varphi 12+(\mathrm{U} 3-\mathrm{U} 2) \times 13 \times \cos \varphi 32$

The following vector diagram shows the vectors for the phase voltages (U1, U2, U 3 ), the phase currents ( $\mathrm{I} 1, \mathrm{I} 2, \mathrm{I} 3$ ) and the element voltages (U1-U2, U3-U2) for
a pure resistive load where the phase currents are in phase with its respective phase voltages.

## 2element metering in a 4-wire system

2-element metering can also be used in a 4-wire system if the current in the neutral connection is zero. Applying this method in a system having a non-zero neutral current will decrease the accuracy, but can sometimes be justified if the current is small compared to the line currents or if high accuracy is not required.

It is also possible to use this method for measuring one current only. This method will only give correct result in a balanced system. Note that the current flows backwards through phase 1 and 3 and that the phase voltages not are connected to the normal inputs when the current transformer is connected to phase 1 and 3.

## Illustration

The following diagrams shows 2-element measurements with only 1 current transformer:

### 7.1.3 3-Phase, 3-Element Metering

## 3-element metering in a 4-wire system

This method is normally used in three phase systems that have a neutral conductor.

In a 3-element meter the neutral voltage is used as the voltage reference and the voltage difference between the neutral voltage and the L1, L2 and L3 voltages are measured and multiplied by its respective current. The active energy consumed
by the load is the product of momentary voltages U1, U2 and U3 and the currents I1, I2 and I3 integrated over the desired measuring time period.

## Illustration

Calculating total active power

The following diagram shows a direct connected 3-element meter measuring the active energy( E) consumed by a load.

In the case where no harmonics are present and the rms values of the voltages and currents are constant, the total active power can be expressed as:
$\mathrm{Ptot}=\mathrm{P} 1+\mathrm{P} 2+\mathrm{P} 3=\mathrm{U} 1 \times \mathrm{I} 1 \times \mathrm{I} 1 \times \cos \varphi 1+(\mathrm{U} 2 \times \mathrm{I} 2 \times \cos \varphi 2+\mathrm{U} 3 \times \mathrm{I} 3 \times \cos \varphi 3$

## 3element metering with the neutral disconnected

Sometimes it is desired to use a 3-element meter without having the neutral connected. It can be done with both transformer connected and direct connected meters.

This can for example be desired in cases where a voltage transformer without a neutral is being used for the moment but where a change to a voltage transformer with neutral will be made sometime in the future. To save the trouble of changing the meter at that time a 3-element meter is used from the beginning.
Using a 3-element meter without having the neutral connected will decrease the accuracy due to the fact that the floating neutral connection on the meter (terminal 11) will lie at a different level than the true neutral ( N ) because of impedance imbalance inside the meter, resulting in the phase voltages not being correct. The imbalance error is usually however rather small (typically $0-2 \%$ ) and if the currents are balanced the total error in the energy measurement will be very small, as a too small energy measurement on one element will be compensated by approximately opposite errors for the other phases.

## Illustration

The following diagram shows a 3-element transformer connected meter with the neutral disconnected:

N $\qquad$

## 3element metering with 2 transformers

It is also possible to use a 3-element meter with only 2 current transformers. This type connection is possible both with and without the neutral available or the neutral left floating.

Note that if the current transformers are connected to protective earth it must be connected in only one point. Both methods require a balanced system (voltages and currents the same in all 3 phases). It shall also be mentioned that having a floating neutral also can give additional errors in the measured voltages due to impedance unlinearity and imbalance inside the meter.

## Illustration

The following diagram shows a 3 -element transformer connected meter with 2 current transformers:

## Illustration

## Summation metering

## Illustration

The following diagram shows a 3 -element transformer connected meter with 2 current transformers and a floating neutral:

The currents from several different transformers can be summed into one single meter.

Note - The summation metring method could also be used with a single phase meter or a 2-element meter

The following illustration shows summation metring with a 3-element transformer connected meter:

# Chapter 8: Service \& Maintenance 

Overview This chapter contains information about service and manitenance of the product.

In this chapter The following topics are covered in this chapter:
8.1 Service and Maintenance

92

### 8.1 Service and Maintenance

## Service

This product contains no parts that can be repaired or exchanged. A broken meter must be replaced.

## Cleaning

If the meter needs to be cleaned, use a lightly moistened cloth with a mild detergent to wipe it.

Caution - Be careful that no liquid gets into the meter since it can ruin the equipment.

## Chapter 9: Communication with Modbus

## Overview

This chapter describes the mapping from meter data to Modbus and how to read and write to registers.

## In this chapter

The following topics are covered in this chapter:
9.1 About the Modbus Protocol ..... 94
9.2 Reading and Writing to Registers ..... 99
9.3 Mapping Tables ..... 100
9.4 Historical Data ..... 111
9.5 Previous Values ..... 119
9.6 Demand ..... 123
9.7 Event logs ..... 127
9.8 Load profile ..... 131
9.9 Configuration ..... 134

### 9.1 About the Modbus Protocol

## General Modbus is a master-slave communication protocol that can support up to 247

 slaves organized as a multidrop bus. The communication is half duplex. Services on Modbus are specified by function codes.The function codes are used to read or write 16 bit registers. All metering data, such as active energy, voltage or firmware version, is represented by one or more such registers. For further information about the relation between register number and metering data, refer to "Mapping Tables" on page - 98.
The Modbus protocol is specified in its entirety in Modbus Application Protocol Specification V1.1b. The document is available at http://www.modbus.org

## Supported function codes

## Modbus request frame

The following function codes are supported:

- Function code 3 (Read holding registers
- Function code 6 (Write single register)
- Function code 16 (Write multiple registers)

A Modbus request frame generally has the following structure:

| Slave Address | Function Code | Data | Error Check |
| :--- | :--- | :--- | :--- |

| Slave address | Modbus slave address, 1 byte. |
| :--- | :--- |
| Function code | Decides the service to be performed. |
| Data | Dependent on the function code. The length varies. |
| Error check | CRC, 2 bytes |

Message types The network messages can be query-response or broadcast type. The query-response command sends a query from the master to an individual slave and is generally followed by a response.
The broadcast command sends a message to all slaves and is never followed by a response. Broadcast is supported by function code 6 and 16 .

### 9.1.1 Function Code 3 (Read holding registers

## General

Function code 3 is used to read measurement values or other information from the electricity meter. It is possible to read up to 125 consecutive registers at a time. This means that multiple values can be read in one request.

## Request frame

Example of a request

A request frame has the following structure:

| Slave Address | Function Code | Address | No. of Registers | Error Check |
| :--- | :--- | :--- | :--- | :--- |

The following is an example of a request. (read total energy import, etc...)

| Slave address | $0 \times 01$ |
| :--- | :--- |
| Function code | $0 \times 03$ |
| Start address, high byte | $0 \times 50$ |
| Start address, low byte | $0 \times 00$ |
| No. of registers, high byte | $0 \times 00$ |
| No. of registers, low byte | $0 \times 18$ |
| Error check (CRC), high byte | $0 \times 54$ |
| Error check (CRC), low byte | $0 \times C 0$ |

## Response frame A response frame has the following structure:

| Slave Address | Function Code | Byte Count | Register Values | Error Check |
| :--- | :--- | :--- | :--- | :--- |

The following is an example of a response:

| Slave address | $0 \times 01$ |
| :--- | :--- |
| Function code | $0 \times 03$ |
| Byte count | $0 \times 30$ |
| Value of register $0 \times 5000$, high byte | $0 \times 00$ |
| Value of register $0 \times 5000$, low byte | $0 \times 15$ |
| $\ldots$ |  |
| Value of register 0x5017, high byte | $0 \times F F$ |
| Value of register $0 \times 5017$, low byte | $0 \times F F$ |
| Error check (CRC), high byte | $0 \times X X$ |
| Error check (CRC), low byte | $0 \times X X$ |

In this example, the slave with the Modbus address 1 responds to a read request. The number of data bytes is $0 \times 30$. The first register ( $0 \times 5000$ ) has the value $0 x 0015$ and the last ( $0 x 5017$ ) has the value $0 x F F F F$

### 9.1.2 Function Code 16 (Write multiple registers)

## General

Function code 16 is used to modify settings in the meter, such as date/time, to control output and to reset values, such as power fail counter. It is possible to write up to 123 consecutive registers in a single request. This means that several settings can be modified and/or several reset operations can be performed in a single request.

## Request frame

## Example of a request

The following is an example of a request (set Date/Time to November 11, 2010, 12:13:14):

| Slave address | $0 \times 01$ |
| :--- | :--- |
| Function code | $0 \times 10$ |
| Start address, high byte | $0 \times 8 \mathrm{~A}$ |
| Start address, low byte | $0 \times 00$ |
| No. of registers, high byte | $0 \times 00$ |
| No. of registers, low byte | $0 \times 03$ |
| Byte count | $0 \times 06$ |
| Value of register 0x8A00, high byte | $0 \times 0 \mathrm{~A}$ |
| Value of register 0x8A00, low byte | $0 \times 0 \mathrm{~B}$ |
| Value of register 0x8A01, high byte | $0 \times 0 \mathrm{~B}$ |
| Value of register 0x8A01, low byte | $0 \times 0 \mathrm{C}$ |
| Value of register 0x8A02, high byte | $0 \times 0 \mathrm{D}$ |
| Value of register $0 \times 8 \mathrm{~A} 02$, low byte | $0 \times 0 \mathrm{E}$ |
| Error check (CRC), high byte | $0 \times 8 \mathrm{C}$ |
| Error check (CRC), low byte | $0 \times 82$ |

In this example the master sends a write request to the slave that has the Modbus address 1 . The first register to write is $0 \times 8 \mathrm{~A} 00$ and the number of registers to write is $0 \times 03$. This means that the registers $0 \times 8 \mathrm{~A} 00$ to 0 x 8 A 02 are written. Register $0 x 8 \mathrm{~A} 00$ is set to the value $0 \times 0 \mathrm{~A} 0 \mathrm{~B}$, and so on.

## Response frame A response frame has the following structure:

| Slave Address | Function Code | Start Address | No. of Registers | Error Check |
| :--- | :--- | :--- | :--- | :--- |

## Example of a response

The following is an example of a response:

| Slave address | $0 \times 01$ |
| :--- | :--- |
| Function code | $0 \times 10$ |
| Register address, high byte | $0 \times 8 \mathrm{~A}$ |
| Register address, low byte | $0 \times 00$ |
| No. of registers, high byte | $0 \times 00$ |
| No. of registers, low byte | $0 \times 03$ |
| Error check (CRC), high byte | $0 \times A A$ |
| Error check (CRC), low byte | $0 \times 10$ |

In the example above the slave with the Modbus address 1 responds to a write request. The first register is $0 \times 8 \mathrm{~A} 00$ and $0 \times 03$ registers have been successfully written to.

### 9.1.3 Function Code 6 (Write single register)

General Function code 6 can be used as an alternative to function code 16 if there is only one register to be written. It can, for example be used to reset the power fail counter.

Request frame A request frame has the following structure:

| Slave Address | Function Code | Register Address | Register Value | Error Check |
| :--- | :--- | :--- | :--- | :--- |

## Example of a request

The following is an example of a request (reset power fail counter):

| Slave address | $0 \times 01$ |
| :--- | :--- |
| Function code | $0 \times 06$ |
| Register address, high byte | $0 \times 8 \mathrm{~F}$ |
| Register address, low byte | $0 \times 00$ |
| No. of registers, high byte | $0 \times 00$ |
| No. of registers, low byte | $0 \times 01$ |

| Error check (CRC), high byte | $0 \times 62$ |
| :--- | :--- |
| Error check (CRC), low byte | $0 \times D E$ |

Response frame Using function code 6, the response frame is an echo of the request frame.

### 9.1.3.1 Exception Responses

General If an error should occur while processing a request, the meter gives an exception response that contains an exception code.

## Exception frame An exception frame has the following structure:

| Slave Address | Function Code | Exception Code | Error Check |
| :--- | :--- | :--- | :--- |

In the exception response the function code is set to the function code of the request plus $0 \times 80$.

Exception codes The exception codes that are used are listed in the following table:

| Exception code | Exception | Definition |
| :--- | :--- | :--- |
| 01 | Illegal function | A function code that is not supported has <br> been used. |
| 02 | Illegal data address | The requested register is outside the al- <br> lowed range. |
| 03 | Illegal data value | The structure of a received message is in- <br> correct. |
| 04 | Processing the request fail due to an inter- <br> nal error in the meter. |  |

### 9.2 Reading and Writing to Registers

## Readable registers

## Multi-register values

## Unused registers

## Writing to

 registersThe readable range in the modbus mapping are registers 1000-8EFF (hexadecimal). Reading any registers within this range will result in a normal Modbus response. It is possible to read any number of registers between 1 and 125, i.e., it is not necessary to read all registers of a quantity listed on one line in the mapping tables. Any attempt to read outside this range will result in an illegal data address exception (Modbus exception code 2).

For quantities that are represented as more than 1 register, the most significant byte is found in the high byte of the first (lowest) register. The least significant byte is found in the low byte of the last (highest) register.

Unused registers within the mapping range, for example missing quantities in the connected meter, will result in a normal Modbus response but the value of the register will be set to "invalid".

For quantities with data type "unsigned", the value will be FFFF in all registers. For quantities with data type "signed", the value is the highest value possible to express. That means that a quantity that is represented by only one register will have the value 7FFF. A quantity that is represented by 2 registers will have the value 7 FFFFFFFF, and so on.

Writing to registers is only permitted to the registers listed as writable in the mapping tables. Attempting to write to a register that is listed as writable but that is not supported by the meter will not result in an error indication.

Note - It is not possible to modify parts of a setting, e.g. to set only the year and month of the Date/time setting.

After you set a value in the meter, it is recommended that you read the value to confirm the result, since it is not possible to confirm if a write was successful from the Modbus response.

### 9.3 Mapping Tables

## Introduction

Contents of the mapping tables

The purpose of this section is to explain the relation between register number and metering data.

The following table explains the content of the mapping tables:

| Quantity | Name of the meter quantity or other information available in the <br> meter. |
| :--- | :--- |
| Details | Refinement of the Quantity column. |
| Start Reg (Hex) | Hexadecimal number for the first (lowest) Modbus Register for <br> this quantity. * |
| Size | Number of Modbus registers for the meter Quantity. A Modbus <br> Register is 16 bits long. |
| Res. | Resolution of the value for this Quantity (if applicable). |
| Unit | Unit for the Quantity (if applicable). |
| Data type | Data type for this Quantity, i.e. how the value in the Modbus reg- <br> isters should be interpreted. |

*It is expressed exactly as it is sent on the bus. That is, it should not be subtracted by 40000 or decremented by 1 , as is common for Modbus products.

Total energy accumulators

All registers in the following table are read only:

| Quantity | Details | Start reg <br> (Hex) | Size | Res. | Unit | Data type |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Active import | kWh | 5000 | 4 | 0,01 | kWh | Unsigned |
| Active export | kWh | 5004 | 4 | 0,01 | kWh | Unsigned |
| Active net | kWh | 5008 | 4 | 0,01 | kWh | Unsigned |
| Reactive import | kvarh | 500 C | 4 | 0,01 | kvarh | Unsigned |
| Reactive export | kvarh | 5010 | 4 | 0,01 | kvarh | Unsigned |
| Reactive net | kvarh | 5014 | 4 | 0,01 | kvarh | Unsigned |
| Apparent import | kVAh | 5018 | 4 | 0,01 | kVAh | Unsigned |
| Apparent export | kVAh | 501 C | 4 | 0,01 | kVAh | Unsigned |
| Apparent net | kVAh | 5020 | 4 | 0,01 | kVAh | Unsigned |
| Active import <br> CO2 | kVAh | 5024 | 4 | 0,001 | kg | Unsigned |
| Active import <br> Currency | kVAh | 5034 | 4 | 0,001 | currency | Unsigned |

## Energy accumulators divided into tariffs

All registers in the following table are read only:

| Quantity | Details | Start reg (Hex) | Size | Res. | Unit | Data type |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Active import | Tariff 1 | 5170 | 4 | 0,01 | kWh | Unsigned |
| Active import | Tariff 2 | 5174 | 4 | 0,01 | kWh | Unsigned |
| Active import | Tariff 3 | 5178 | 4 | 0,01 | kWh | Unsigned |
| Active import | Tariff 4 | 517C | 4 | 0,01 | kWh | Unsigned |
| Active export | Tariff 1 | 5190 | 4 | 0,01 | kWh | Unsigned |
| Active export | Tariff 2 | 5194 | 4 | 0,01 | kWh | Unsigned |
| Active export | Tariff 3 | 5198 | 4 | 0,01 | kWh | Unsigned |
| Active export | Tariff 4 | 519C | 4 | 0,01 | kWh | Unsigned |
| Reactive import | Tariff 1 | 51B0 | 4 | 0,01 | kvarh | Unsigned |
| Reactive import | Tariff 2 | 51B4 | 4 | 0,01 | kvarh | Unsigned |
| Reactive import | Tariff 3 | 51B8 | 4 | 0,01 | kvarh | Unsigned |
| Reactive import | Tariff 4 | 51BC | 4 | 0,01 | kvarh | Unsigned |
| Reactive export | Tariff 1 | 51D0 | 4 | 0,01 | kvarh | Unsigned |
| Reactive export | Tariff 2 | 51D4 | 4 | 0,01 | kvarh | Unsigned |
| Reactive export | Tariff 3 | 51D8 | 4 | 0,01 | kvarh | Unsigned |
| Reactive export | Tariff 4 | 51DC | 4 | 0,01 | kvarh | Unsigned |

## Energy accumulators per phase

All registers in the following table are read only:

| Quantity | Details | Start reg (Hex) | Size | Res. | Unit | Data type |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Active import | L1 | 5460 | 4 | 0,01 | kWh | Unsigned |
| Active import | L2 | 5464 | 4 | 0,01 | kWh | Unsigned |
| Active import | L3 | 5468 | 4 | 0,01 | kWh | Unsigned |
| Active export | L 1 | 546 C | 4 | 0,01 | kWh | Unsigned |
| Active export | L2 | 5470 | 4 | 0,01 | kWh | Unsigned |
| Active export | L3 | 5474 | 4 | 0,01 | kWh | Unsigned |
| Active net | L1 | 5478 | 4 | 0,01 | kWh | Unsigned |
| Active net | L2 | 547 C | 4 | 0,01 | kWh | Unsigned |
| Active net | L 3 | 5480 | 4 | 0,01 | kWh | Unsigned |

| Quantity | Details | Start reg (Hex) | Size | Res. | Unit | Data type |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Reactive import | L1 | 5484 | 4 | 0,01 | kvarh | Unsigned |
| Reactive import | L2 | 5488 | 4 | 0,01 | kvarh | Unsigned |
| Reactive import | L3 | 548 C | 4 | 0,01 | kvarh | Unsigned |
| Reactive export | L1 | 5490 | 4 | 0,01 | kvarh | Unsigned |
| Reactive export | L2 | 5494 | 4 | 0,01 | kvarh | Unsigned |
| Reactive export | L3 | 5498 | 4 | 0,01 | kvarh | Unsigned |
| Reactive net | L1 | $549 C$ | 4 | 0,01 | kvarh | Unsigned |
| Reactive net | L2 | 54 A0 | 4 | 0,01 | kvarh | Unsigned |
| Reactive net | L3 | 54 A4 | 4 | 0,01 | kvarh | Unsigned |
| Apparent import | L1 | 54 A8 | 4 | 0,01 | kVAh | Unsigned |
| Apparent import | L2 | 54 AC | 4 | 0,01 | kVAh | Unsigned |
| Apparent import | L3 | $54 B 0$ | 4 | 0,01 | kVAh | Unsigned |
| Apparent export | L1 | $54 B 4$ | 4 | 0,01 | kVAh | Unsigned |
| Apparent export | L2 | $54 B 8$ | 4 | 0,01 | kVAh | Unsigned |
| Apparent export | L3 | $54 B C$ | 4 | 0,01 | kVAh | Unsigned |
| Apparent net | L1 | $54 C 0$ | 4 | 0,01 | kVAh | Unsigned |
| Apparent net | L2 | $54 C 4$ | 4 | 0,01 | kVAh | Unsigned |
| Apparent net | L3 | $54 C 8$ | 4 | 0,01 | kVAh | Unsigned |

## Resettable energy accumulators

All registers in the following table are read only:

| Quantity | Start reg <br> (Hex) | Size | Res. | Unit | Data type |
| :--- | :--- | :--- | :--- | :--- | :--- |
| Resettable active <br> import | 552 C | 4 | 0,01 | kWh | Unsigned |
| Resettable active <br> export | 5530 | 4 | 0,01 | kWh | Unsigned |
| Resettable reac- <br> tive import | 5534 | 4 | 0,01 | kWh | Unsigned |
| Resettable reac- <br> tive export | 5538 | 4 | 0,01 | kWh | Unsigned |

## Instantaneous values

All registers in the following table are read only：

| Quantity | Details | Start reg （Hex） | Size | Res． | Unit | Value range | Data type |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Voltage | L1－N | 5B00 | 2 | 0，1 | V |  | Unsigned |
| Voltage | L2－N | 5B02 | 2 | 0，1 | V |  | Unsigned |
| Voltage | L3－N | 5B04 | 2 | 0，1 | V |  | Unsigned |
| Voltage | L1－L2 | 5B06 | 2 | 0，1 | V |  | Unsigned |
| Voltage | L3－L2 | 5B08 | 2 | 0，1 | V |  | Unsigned |
| Voltage | L1－L3 | 5B0A | 2 | 0，1 | V |  | Unsigned |
| Current | L1 | 5B0C | 2 | 0，01 | A |  | Unsigned |
| Current | L2 | 5B0E | 2 | 0，01 | A |  | Unsigned |
| Current | L3 | 5B10 | 2 | 0，01 | A |  | Unsigned |
| Current | N | 5B12 | 2 | 0，01 | A |  | Unsigned |
| Active power | Total | 5B14 | 2 | 0，01 | W |  | Signed |
| Active power | L1 | 5B16 | 2 | 0，01 | W |  | Signed |
| Active power | L2 | 5B18 | 2 | 0，01 | W |  | Signed |
| Active power | L3 | 5B1A | 2 | 0，01 | W |  | Signed |
| Reactive power | Total | 5B1C | 2 | 0，01 | var |  | Signed |
| Reactive power | L1 | 5B1E | 2 | 0，01 | var |  | Signed |
| Reactive power | L2 | 5B20 | 2 | 0，01 | var |  | Signed |
| Reactive power | L3 | 5B22 | 2 | 0，01 | var |  | Signed |
| Apparent power | Total | 5B24 | 2 | 0，01 | VA |  | Signed |
| Apparent power | L1 | 5B26 | 2 | 0，01 | VA |  | Signed |
| Apparent power | L2 | 5B28 | 2 | 0，01 | VA |  | Signed |
| Apparent power | L3 | 5B2A | 2 | 0，01 | VA |  | Signed |
| Frequency |  | 5B2C | 1 | 0，01 | Hz |  | Unsigned |
| Phase angle power | Total | 5B2D | 1 | 0，1 | 。 | $-180^{\circ}-+180^{\circ}$ | Signed |
| Phase angle power | L1 | 5B2E | 1 | 0，1 | 。 | $-180^{\circ}-+180^{\circ}$ | Signed |
| Phase angle power | L2 | 5B2F | 1 | 0，1 | 。 | $-180^{\circ}-+180^{\circ}$ | Signed |
| Phase angle power | L3 | 5B30 | 1 | 0，1 | 。 | $-180^{\circ}-+180^{\circ}$ | Signed |
| Phase angle voltage | L1 | 5B31 | 1 | 0，1 | 。 | $-180^{\circ}-+180^{\circ}$ | Signed |
| Phase angle voltage | L2 | 5B32 | 1 | 0，1 | 。 | $-180^{\circ}-+180^{\circ}$ | Signed |
| Phase angle voltage | L3 | 5B33 | 1 | 0，1 | 。 | $-180^{\circ}-+180^{\circ}$ | Signed |
| Phase angle current | L1 | 5B37 | 1 | 0，1 | 。 | $-180^{\circ}++180^{\circ}$ | Signed |
| Phase angle current | L2 | 5B38 | 1 | 0，1 | 。 | $-180^{\circ}++180^{\circ}$ | Signed |
| Phase angle current | L3 | 5B39 | 1 | 0，1 | 。 | $-180^{\circ}++180^{\circ}$ | Signed |
| Power factor | Total | 5B3A | 1 | 0，001 | － | －1，000－＋1，000 | Signed |
| Power factor | L1 | 5B3B | 1 | 0，001 | － | －1，000－＋1，000 | Signed |
| Power factor | L2 | 5B3C | 1 | 0，001 | － | －1，000－＋1，000 | Signed |

| Quantity | Details | Start <br> reg <br> (Hex) | Size | Res. | Unit | Value range | Data <br> type |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Power factor | L3 | 5B3D | 1 | 0,001 | - | $-1,000-+1,000$ | Signed |
| Current quadrant | Total | 5B3E | 1 |  | - | $1-4$ | Unsigned |
| Current quadrant | L1 | $5 B 3 F$ | 1 |  | - | $1-4$ | Unsigned |
| Current quadrant | L2 | $5 B 40$ | 1 |  | - | $1-4$ | Unsigned |
| Current quadrant | L3 | $5 B 41$ | 1 |  | - | $1-4$ | Unsigned |

Note - Powers are sent out as 32 bit signed integers, expressed in W (or var/VA) with 2 decimals. This means that the maximum power possible to express is approximately $\pm 21 \mathrm{MW}$. If the power is higher than that the user is adviced to read power from the DMTME mapping instead, where the scaling is in W without decimals.

## Harmonics

Inputs and outputs

Harmonics are mapped in 2 registers each, starting with THD and then followed by 2 nd, 3 rd , 4th harmonic and so on.

All registers in the following table are read only:

| Quantity | Details | Start <br> reg <br> (Hex) | Size/ <br> harmonic | Nr of <br> harmonics | Res. | Unit | Data type |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Voltage harmonics | L1-N | 5 D00 | 2 | 16 | 0,1 | $\%$ | Unsigned |
| Voltage harmonics | L2-N | 5 D80 | 2 | 16 | 0,1 | $\%$ | Unsigned |
| Voltage harmonics | L3-N | 5 E00 | 2 | 16 | 0,1 | $\%$ | Unsigned |
| Voltage harmonics | L1-L2 | 5 E80 | 2 | 16 | 0,1 | $\%$ | Unsigned |
| Voltage harmonics | L3-L2 | 5 F00 | 2 | 16 | 0,1 | $\%$ | Unsigned |
| Voltage harmonics | L1-L3 | 5 F80 | 2 | 16 | 0,1 | $\%$ | Unsigned |
| Current harmonics | L1 | 6000 | 2 | 16 | 0,1 | $\%$ | Unsigned |
| Current harmonics | L2 | 6080 | 2 | 16 | 0,1 | $\%$ | Unsigned |
| Current harmonics | L3 | 6100 | 2 | 16 | 0,1 | $\%$ | Unsigned |
| Current harmonics | N | 6180 | 2 | 16 | 0,1 | $\%$ | Unsigned |

The following table contains both writable and read only registers:

| Quantity | Details | Start <br> Reg <br> (Hex) | Size | Possible values | Data type | Read/ <br> Write |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Output 1 |  | 6300 | 1 | $\mathrm{ON}=1$, OFF=0 | Unsigned | R/W |

| Quantity | Details | Start <br> Reg <br> $(\mathrm{Hex})$ | Size | Possible values | Data type | Read/ <br> Write |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Output 2 |  | 6301 | 1 | $\mathrm{ON}=1$, OFF=0 | Unsigned | $\mathrm{R} / \mathrm{W}$ |
| Output 3 |  | 6302 | 1 | $\mathrm{ON}=1$, OFF=0 | Unsigned | $\mathrm{R} / \mathrm{W}$ |
| Output 4 |  | 6303 | 1 | $\mathrm{ON}=1$, OFF=0 | Unsigned | $\mathrm{R} / \mathrm{W}$ |
| Input 1 | Current state | 6308 | 1 | $\mathrm{ON}=1, \mathrm{OFF}=0$ | Unsigned | R |
| Input 2 | Current state | 6309 | 1 | $\mathrm{ON}=1$, OFF=0 | Unsigned | R |
| Input 3 | Current state | 630 A | 1 | $\mathrm{ON}=1, \mathrm{OFF}=0$ | Unsigned | R |
| Input 4 | Current state | 630 B | 1 | $\mathrm{ON}=1, \mathrm{OFF}=0$ | Unsigned | R |
| Input 1 | Stored state | 6310 | 1 | $\mathrm{ON}=1, \mathrm{OFF}=0$ | Unsigned | R |
| Input 2 | Stored state | 6311 | 1 | $\mathrm{ON}=1, \mathrm{OFF}=0$ | Unsigned | R |
| Input 3 | Stored state | 6312 | 1 | $\mathrm{ON}=1, \mathrm{OFF}=0$ | Unsigned | R |
| Input 4 | Stored state | 6313 | 1 | $\mathrm{ON}=1, \mathrm{OFF}=0$ | Unsigned | R |
| Input 1 | Counter | 6318 | 4 |  | Unsigned | R |
| Input 2 | Counter | 631 C | 4 |  | Unsigned | R |
| Input 3 | Counter | 6320 | 4 |  | Unsigned | R |
| Input 4 | Counter | 6324 | 4 |  | R |  |

Production data and identification

All registers in the following table are read only:

| Quantity | Start Reg (Hex) | Size | Data type |
| :--- | :--- | :--- | :--- |
| Serial number | 8900 | 2 | Unsigned |
| Meter firmware version | 8908 | 8 | ASCII string (up to 16 charac- <br> ters) |
| Modbus mapping version | 8910 | 1 | 2 bytes |
| Type designation | 8960 | 6 | ASCII string (12 characters, in- <br> cluding null termination) |

Meter firmware version is expressed as a string of 3 digits separated by periods, e.g. 1.0.0. Unused bytes at the end are set to binary 0.

In the Modbus mapping version register the high byte corresponds to the Major version (1-255), and the low byte corresponds to the Minor version (0-255).

## Miscellaneous

In the following table Date/time and current tariff are writable. All other registers are read only:

| Quantity | Start Reg <br> (Hex) | Description | Size | Data type | Read/ Write |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Date/time | 8A00 | Byte 0: year* <br> Byte 1: month <br> Byte 2: day <br> Byte 3: hour <br> Byte 4: minute <br> Byte 5: second | 3 | Date/Time | R/W |
| Day of week | 8A03 | Weekdays (1-7, $M o=1 \text { ) }$ | 1 | Unsigned | R |
| DST active | 8A04 | 1=DST active $0=$ DST inactive | 1 | Unsigned | R |
| Day type | 8A05 | Value 0-3 correspond to day type 1-4 | 1 | Unsigned | R |
| Season | 8A06 | Value 0-3 correspond to season 1-4 | 1 | Unsigned | R |
| Current tariff | 8A07 | Tariff 1-4 | 1 | Unsigned | R/W |
| Error flags | 8A13 | 64 flags | 4 | Bit string | R |
| Information flags | 8A19 | 64 flags | 4 | Bit string | R |
| Warning flags | 8A1F | 64 flags | 4 | Bit string | R |
| Alarm flags | 8A25 | 64 flags | 4 | Bit string | R |
| Power fail counter | 8A2F |  | 1 | Unsigned | R |
| Power outage time | 8A39 | Byte 0-2: days* Byte 3: hours Byte 4: minutes Byte 5: seconds | 3 | Date/Time | R |
| Reset counter for active energy import | 8A48 |  | 4 | Unsigned | R |
| Reset counter for active energy export | 8A4C |  | 4 | Unsigned | R |
| Reset counter for reactive energy import | 8A50 |  | 4 | Unsigned | R |
| Reset counter for reactive energy export | 8A54 |  | 4 | Unsigned | R |

* Byte 0 is the highest byte of the lowest register

The Reset counter registers show the number of times the resettable energy accumulators have been reset.

## Settings <br> All registers in the following table have read and write access:

| Quantity | Start <br> Reg <br> (hex) | Size | Res. | Unit | Data type |
| :--- | :--- | :--- | :--- | :--- | :--- |
| Current transformer ratio <br> numerator | 8 C04 | 2 |  | - | Unsigned |
| Voltage transformer ratio <br> numerator | 8 C06 | 2 |  | - | Unsigned |
| Current transformer ratio <br> denominator | 8 C08 | 2 |  | - | Unsigned |
| Voltage transformer ratio <br> denominator | 8 C0A | 2 |  | - | Unsigned |
| CO2 conversion factor | 8 CE0 | 2 | 0.001 | $\mathrm{~kg} / \mathrm{kWh}$ | Unsigned |
| Currency conversion factor <br> CCE2 | 2 | 0.01 | Currency/ <br> kWh | Unsigned |  |
| LED source (0 = active en- <br> ergy, 1 = reactive energy) | 8 8CE4 | 1 |  | - | Unsigned |
| Number of elements (values <br> 1-3) | 8 CE 5 | 1 |  | - | Unsigned |

Operations
All registers in the following table are write only:

| Quantity | Details | Start <br> Reg <br> (hex) | Size | Action | Data type |
| :--- | :--- | :--- | :--- | :--- | :--- |
| Reset power fail coun- <br> ter |  | 8 F00 | 1 | Write the value 1 to <br> perform a reset | Unsigned |
| Reset power outage <br> time |  | 8 F05 | 1 | Write the value 1 to <br> perform a reset | Unsigned |
| Reset input counter | Input 1 | 8 F0B | 1 | Write the value 1 to <br> perform a reset | Unsigned |
| Reset input counter | Input 2 | $8 F 0 C$ | 1 | Write the value 1 to <br> perform a reset | Unsigned |
| Reset input counter | Input 3 | 8F0D | 1 | Write the value 1 to <br> perform a reset | Unsigned |
| Reset input counter | Input 4 | 8F0E | 1 | Write the value 1 to <br> perform a reset | Unsigned |

| Quantity | Details | Start Reg (hex) | Size | Action | Data type |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Reset stored state | input 1 | 8F13 | 1 | Write the value 1 to perform a reset | Unsigned |
| Reset stored state | Input 2 | 8F14 | 1 | Write the value 1 to perform a reset | Unsigned |
| Reset stored state | input 3 | 8F15 | 1 | Write the value 1 to perform a reset | Unsigned |
| Reset stored state | Input 4 | 8F16 | 1 | Write the value 1 to perform a reset | Unsigned |
| Reset resettable active energy import |  | 8F1B | 1 | Write the value 1 to perform a reset | Unsigned |
| Reset resettable active energy export |  | 8F1C | 1 | Write the value 1 to perform a reset | Unsigned |
| Reset resettable reactive energy import |  | 8F1D | 1 | Write the value 1 to perform a reset | Unsigned |
| Reset resettable reactive energy export |  | 8F1E | 1 | Write the value 1 to perform a reset | Unsigned |
| Reset Previous values |  | 8F1F | 1 | Write the value 1 to perform a reset | Unsigned |
| Reset Demand |  | 8F20 | 1 | Write the value 1 to perform a reset | Unsigned |
| Reset Load profile channel 1 |  | 8F21 | 1 | Write the value 1 to perform a reset | Unsigned |
| Reset Load profile channel 2 |  | 8F22 | 1 | Write the value 1 to perform a reset | Unsigned |
| Reset Load profile channel 3 |  | 8F23 | 1 | Write the value 1 to perform a reset | Unsigned |
| Reset Load profile channel 4 |  | 8F24 | 1 | Write the value 1 to perform a reset | Unsigned |
| Reset Load profile channel 5 |  | 8F25 | 1 | Write the value 1 to perform a reset | Unsigned |
| Reset Load profile channel 6 |  | 8F26 | 1 | Write the value 1 to perform a reset | Unsigned |
| Reset Load profile channel 7 |  | 8F27 | 1 | Write the value 1 to perform a reset | Unsigned |
| Reset Load profile channel 8 |  | 8F28 | 1 | Write the value 1 to perform a reset | Unsigned |
| Reset System log |  | 8F31 | 1 | Write the value 1 to perform a reset | Unsigned |

| Quantity | Details | Start <br> Reg <br> (hex) | Size | Action | Data type |
| :--- | :--- | :--- | :--- | :--- | :--- |
| Reset Event log |  | $8 F 32$ | 1 | Write the value 1 to <br> perform a reset | Unsigned |
| Reset Net quality log |  | $8 F 33$ | 1 | Write the value 1 to <br> perform a reset | Unsigned |
| Reset Communication <br> log |  | $8 F 34$ | 1 | Write the value 1 to <br> perform a reset | Unsigned |
| Freeze demand |  | $8 F 70$ | 1 | Write the value 1 to <br> freeze the demand <br> values | Unsigned |

## DMTME multimeters

Parts of the Modbus mapping is compatible with the ABB DMTME multimeters. All registers in the following table are read only:

| Quantity | Start Reg (Hex) | Size | Unit | Data type |
| :--- | :--- | :--- | :--- | :--- |
| Phase Voltage L1-N | 1002 | 2 | Volt | Unsigned |
| Phase Voltage L2-N | 1004 | 2 | Volt | Unsigned |
| Phase Voltage L3-N | 1006 | 2 | Volt | Unsigned |
| Line Voltage L1-L2 | 1008 | 2 | Volt | Unsigned |
| Line Voltage L2-L3 | 100 A | 2 | Volt | Unsigned |
| Line Voltage L1-L3 | 100 C | 2 | Volt | Unsigned |
| Line Current L1 | 1010 | 2 | mA | Unsigned |
| Line Current L2 | 1012 | 2 | mA | Unsigned |
| Line Current L3 | 1014 | 2 | mA | Unsigned |
| 3-Phase Sys. Power Factor | 1016 | 2 | *1000 | Signed |
| Power Factor L1 | 1018 | 2 | *1000 | Signed |
| Power Factor L2 | 101 A | 2 | *1000 | Signed |
| power Factor L3 | 101 C | 2 | *1000 | Signed |
| 3-Phase Sys. Apparent Power | 1026 | 2 | VA | Unsigned |
| Apparent Power L1 | 1028 | 2 | VA | Unsigned |
| Apparent Power L2 | 102 A | 2 | VA | Unsigned |
| Apparent Power L3 | 102 C | 2 | VA | Unsigned |
| 3-Phase Sys. Active Power | 102 E | 2 | Watt | Unsigned |
| Active Power L1 | 1030 | 2 | Watt | Unsigned |
|  |  |  |  |  |

| Quantity | Start Reg (Hex) | Size | Unit | Data type |
| :--- | :--- | :--- | :--- | :--- |
| Active Power L2 | 1032 | 2 | Watt | Unsigned |
| Active Power L3 | 1034 | 2 | Watt | Unsigned |
| 3-Phase Reactive power | 1036 | 2 | VAr | Unsigned |
| Reactive Power L1 | 1038 | 2 | VAr | Unsigned |
| Reactive power L2 | 103 A | 2 | VAr | Unsigned |
| Reactive Power L3 | 103 C | 2 | VAr | Unsigned |
| 3-Phase Sys. Active energy | 103 E | 2 | Wh*100 | Unsigned |
| 3-Phase Sys. Reactive energy | 1040 | 2 | VArh*100 | Unsigned |
| Frequency | 1046 | 2 | mHz | Unsigned |
| Current transformer ratio | $11 \mathrm{A0}$ | 2 | $1-999999$ | Unsigned |
| Voltage transformer ratio | 11 A 2 | 2 | $1-9999$ | Unsigned |

### 9.4 Historical Data

## General

## Header registers

## Get next entry register

In the Modbus mapping all historical data is organized as entries. This concerns Previous values, Demand, Load profile and Event logs.

Entry number 1 is the most recent entry, entry number 2 is the second most recent, and so on. Entry number 0 is not used.
Readout of all types of historical values is made by writing to a group of registers called Header and reading from one or more groups of registers called Data blocks.

The Header is used for controlling readout with respect to date/time or entry numbers, and for loading new entries into the Data blocks. The data blocks contain the actual data, for example event log entries or energy values.
When there are no more entries to read all registers in the Data blocks are set to $0 x F F F F$.

There are a number of standard commands that are used in the same way when reading out any type of historical data. These are represented by registers in the Header, separately mapped for each functionality, but with the same names.
The following table describes the common header registers:

| Function | Size | Description | Data type | Read/ <br> write |
| :--- | :--- | :--- | :--- | :--- |
| Get next entry | 1 | Write the value 1 to this register to load <br> new values in the Data block(s) | Unsigned | R/W |
| Entry number | 1 | Write to this register to choose an entry <br> number to start reading from | Unsigned | R/W |
| Date/Time | 3 | Write to this register to choose a date/ <br> time to start reading from | Date/Time <br> (see below) | R/W |
| Direction | 1 | Write to this register to choose the direc- <br> tion of reading | Unsigned | R/W |

The Get next entry register is used to continue an ongoing readout, which was started by writing to any of the Entry number, Date/Time or Direction registers.
If the direction in Direction register is set to backward the Data block is loaded with older data. And correspondingly, if the direction is set to forward the Data block is loaded with more recent data.

## Entry number The Entry number register is used to specify an entry number to start reading register

## Date/Time register

## Direction register

The Direction register is used to control the direction in time in which the entries are read. Possible values are shown in the table below:

| Value | Description |
| :--- | :--- |
| 0 | Backwards, i.e. from recent entries towards older entries |
| 1 | Forward, i.e. from old entries towards recent entries |

The default value of Entry number register after a restart is 0 , i.e. backwards.

## Data block registers

There are a number of standard data items that are used in the same way when reading out any type of historical data. These are represented by registers in the Data block, separately mapped for each functionality, but with the same names.
The following table describes the common Data block registers:

| Function | Size | Description | Data type | Read <br> /write |
| :--- | :--- | :--- | :--- | :--- |
| Timestamp | 3 | The date and time on which the value was <br> stored | Date/Time | R/W |
| Quantity | 3 | OBIS code for the quantity concerned | 6 byte se- <br> quence | R/W |

| Function | Size | Description | Data type | Read <br> /write |
| :--- | :--- | :--- | :--- | :--- |
| Data type | 1 | Data type for the value of the quantity con- <br> cerned | Unsigned | R/W |
| Scaler | 1 | Scaling of the value for the quantity concerned | Signed | R/W |

## Timestamp

Quantity registers

The date and time on which the value was stored. How to interpret the data in these registers is described in. "Date and time format" on page - 112

The OBIS code for a quantity in for example a load profile channel or previous values channel. A list of OBIS codes is found in "Quantity identifiers" on page - 112.

The table below shows an example of how an OBIS code is mapped to the Quantity registers. The OBIS code used is for active energy import total: 1.0.1.8.0.255.

| Byte <br> number | Comment on byte order | Value (in case of active <br> energy import total) |
| :--- | :--- | :--- |
| 0 | Most significant byte of lowest register | 1 |
| 1 | Least significant byte of lowest register | 0 |
| 2 | $\ldots$ | 1 |
| 3 | $\ldots$ | 8 |
| 4 | $\ldots$ | 0 |
| 5 | Least significant byte of highest register | 255 |

Data type register
The data type register contains a data type identifier that is a value between 0 and 255. Currently only two identifiers are used for historical values. The identifier for 64 bit unsigned integer is 21 and the identifier for 64 bit signed integer is 20 .

The scaler register shows the resolution of the value. The measured value in the Value register should be interpreted as value* $10^{\text {scaler }}$. For example, the prefix kilo is represented by scaler 3 while milli is -3 . An energy accumulator with the resolution $0,01 \mathrm{kWh}$ consequently has scaler 1 .

## Date and time format

The same date and time format is used wherever a date and time occurs in the registers, e.g. the Date/Time register in the Header or a timestamp in the Data block. The following table shows the structure of date and time in the mapping:

| Byte <br> number | Description | Comment on byte order |
| :--- | :--- | :--- |
| 0 | Year | Most significant byte of lowest register |
| 1 | Month | Least significant byte of lowest register |
| 2 | Day | $\ldots$ |
| 3 | Hour | $\ldots$ |
| 4 | Minute | $\ldots$ |
| 5 | Second | Least significant byte of highest register |

## Response times

The Headers for reading out historical values include one or more of the registers Entry number, Date/Time, Direction and Get next entry for controlling the readout.

When writing to any of the registers Entry number, Date/Time or Direction a new search is started in the persistent storage, which can take a long time depending on how old the entry searched for is. The response from Modbus is given after the search is finished, i.e. when the requested entry has been found.

Recent entries are found fast, whereas finding the oldest can take seconds or even up to about a minute if there are many thousands of newer values. It is therefore preferable to start reading from a recent entry number or date/time and then go backwards in time.

Writing to the Get next entry register continues the ongoing search and consequently goes fast.

### 9.4.1 Quantity identifiers

The quantities stored in Previous values, Demand and Load profile are identified by OBIS codes. The OBIS code is a 6 byte identifier. The tables below list the OBIS codes for all quantities possible to configure.

The following table lists the OBIS codes for total energies:

| Quantity | OBIS code |
| :--- | :--- |
| Active energy import total | 1.0 .1 .8 .0 .255 |
| Active energy export total | 1.0 .2 .8 .0 .255 |
| Active energy net total | 1.0 .16 .8 .0 .255 |
| Reactive energy import total | 1.0 .3 .8 .0 .255 |

| Quantity | OBIS code |
| :--- | :--- |
| Reactive energy export total | 1.0 .4 .8 .0 .255 |
| Reactive energy net total | 1.0 .128 .8 .0 .255 |
| Apparent energy import total | 1.0 .9 .8 .0 .255 |
| Apparent energy export total | 1.0 .10 .8 .0 .255 |
| Apparent energy net total | 1.0 .137 .8 .0 .255 |
| Active energy import total CO2 | 1.0 .1 .8 .200 .255 |
| Active energy import total Currency | 1.0 .1 .8 .220 .255 |

Energies per tariff The following table lists the OBIS codes for energies per tariff:

| Quantity | OBIS code |
| :--- | :--- |
| Active energy import tariff 1 | 1.0 .1 .8 .1 .255 |
| Active energy import tariff 2 | 1.0 .1 .8 .2 .255 |
| Active energy import tariff 3 | 1.0 .1 .8 .3 .255 |
| Active energy import tariff 4 | 1.0 .1 .8 .4 .255 |
| Active energy export tariff 1 | 1.0 .2 .8 .1 .255 |
| Active energy export tariff 2 | 1.0 .2 .8 .2 .255 |
| Active energy export tariff 3 | 1.0 .2 .8 .3 .255 |
| Active energy export tariff 4 | 1.0 .2 .8 .4 .255 |
| Reactive energy import tariff 1 | 1.0 .3 .8 .1 .255 |
| Reactive energy import tariff 2 | 1.0 .3 .8 .2 .255 |
| Reactive energy import tariff 3 | 1.0 .3 .8 .3 .255 |
| Reactive energy import tariff 4 | 1.0 .3 .8 .4 .255 |
| Reactive energy export tariff 1 | 1.0 .4 .8 .1 .255 |
| Reactive energy export tariff 2 | 1.0 .4 .8 .2 .255 |
| Reactive energy export tariff 3 | 1.0 .4 .8 .3 .255 |
| Reactive energy export tariff 4 | 1.0 .4 .8 .4 .255 |

Energies per The following table lists the OBIS codes for energies per phase:
phase

| Quantity | OBIS code |
| :--- | :--- |
| Active energy import L1 | 1.0.21.8.0.255 |
| Active energy import L2 | 1.0.41.8.0.255 |

| Quantity | OBIS code |
| :--- | :--- |
| Active energy import L3 | 1.0.61.8.0.255 |
| Active energy export L1 | 1.0 .22 .8 .0 .255 |
| Active energy export L2 | 1.0 .42 .8 .0 .255 |
| Active energy export L3 | 1.0 .62 .8 .0 .255 |
| Active energy net L1 | 1.0 .36 .8 .0 .255 |
| Active energy net L2 | 1.0 .56 .8 .0 .255 |
| Active energy net L3 | 1.0 .76 .8 .0 .255 |
| Reactive energy import L1 | 1.0 .23 .8 .0 .255 |
| Reactive energy import L2 | 1.0 .43 .8 .0 .255 |
| Reactive energy import L3 | 1.0 .63 .8 .0 .255 |
| Reactive energy export L1 | 1.0 .24 .8 .0 .255 |
| Reactive energy export L2 | 1.0 .44 .8 .0 .255 |
| Reactive energy export L3 | 1.0 .64 .8 .0 .255 |
| Reactive energy net L1 | 1.0 .129 .8 .0 .255 |
| Reactive energy net L2 | 1.0 .130 .8 .0 .255 |
| Reactive energy net L3 | 1.0 .131 .8 .0 .255 |
| Apparent energy import L1 | 1.0 .29 .8 .0 .255 |
| Apparent energy import L2 | 1.0 .49 .8 .0 .255 |
| Apparent energy import L3 | 1.0 .69 .8 .0 .255 |
| Apparent energy export L1 | 1.0 .30 .8 .0 .255 |
| Apparent energy export L2 | 1.0 .50 .8 .0 .255 |
| Apparent energy export L3 | 1.0 .70 .8 .0 .255 |
| Apparent energy net L1 | 1.0 .138 .8 .0 .255 |
| Apparent energy net L2 | 1.0 .139 .8 .0 .255 |
| Apparent energy net L3 | 1.0 .140 .8 .0 .255 |
|  |  |
|  |  |

Pulse input counters

The following table lists the OBIS codes for pulse input counters:

| Quantity | OBIS code |
| :--- | :--- |
| Input 1 counter | 1.128 .82 .8 .0 .255 |
| Input 2 counter | 1.129 .82 .8 .0 .255 |
| Input 3 counter | 1.130 .82 .8 .0 .255 |
| Input 4 counter | 1.131 .82 .8 .0 .255 |

## Averages of instrumentation values

Averages of instrumentation values are used in load profile recording.
The following table lists the OBIS codes for averaging of instrumentation values:

| Quantity | OBIS code |
| :--- | :--- |
| Voltage L1 | 1.0 .32 .27 .0 .255 |
| Voltage L2 | 1.0 .52 .27 .0 .255 |
| Voltage L3 | 1.0 .72 .27 .0 .255 |
| Voltage L1-L2 | 1.0 .134 .27 .0 .255 |
| Voltage L2-L3 | 1.0 .135 .27 .0 .255 |
| Voltage L1-L3 | 1.0 .136 .27 .0 .255 |
| Current L1 | 1.0 .31 .27 .0 .255 |
| Current L2 | 1.0 .51 .27 .0 .255 |
| Current L3 | 1.0 .71 .27 .0 .255 |
| Current N | 1.0 .91 .27 .0 .255 |
| Power factor total | 1.0 .13 .27 .0 .255 |
| Power factor L1 | 1.0 .33 .27 .0 .255 |
| Power factor L2 | 1.0 .53 .27 .0 .255 |
| Power factor L3 | 1.0 .73 .27 .0 .255 |

## Min/Max of instrumentation values and powers

Minimum and maximum of instrumentation values and powers are used for the Demand function. In the table below the byte shown as $X$ can have any of the values $3,6,13$ or 16 . The meaning of these values is described after the OBIS code table.

The following table lists the OBIS codes for minimum/maximum of instrumentation values and powers:

| Quantity | OBIS code |
| :--- | :--- |
| Voltage L1 | $1.0 .32 . \times .0 .255$ |
| Voltage L2 | $1.0 .52 . \times .0 .255$ |
| Voltage L3 | $1.0 .72 . \times .0 .255$ |
| Voltage L1-L2 | 1.0 .134. X.0.255 |
| Voltage L2-L3 | $1.0 .135 . \times .0 .255$ |
| Voltage L1-L3 | 1.0 .136. X. 0.255 |

X-values The following table lists the meaning of the values for X :

| Value of $\mathbf{X}$ | Meaning |
| :--- | :--- |
| 3 | Minimum value of averages calculated over measurement period 1 |
| 6 | Maximum value of averages calculated over measurement period 1 |
| 13 | Minimum value of averages calculated over measurement period 2 |
| 16 | Maximum value of averages calculated over measurement period 2 |

Note - Measurement period 1 is currently used for block demand and measuremet period 2 is used for sliding demand.

### 9.5 Previous Values

Note - Before you can use the information in this chapter you must be familiar with and understand the information and the concepts described in "Historical Data" on page - 109.

## Mapping table

## Header

## Data blocks

The following table describes the header:

| Function | Start <br> Reg <br> (Hex) | Size | Description | Read/ <br> write |
| :--- | :--- | :--- | :--- | :--- |
| Get next entry | 8000 | 1 | Write value 1 to this register to load the <br> next block of values and timestamp | R/W |
| Entry number | 8001 | 1 | Write to this register to choose an entry <br> number to start reading from | R/W |
| Date/Time | 8004 | 3 | Write to this register to choose a date/time <br> to start reading from | R/W |
| Direction | 8007 | 1 | Write to this register to choose the dirac- <br> timon of reading | R/W |

The Data blocks contain the history of previous values. Data block 1 to 7 have the same structure. Each block can contain up to 8 channels. Consequently, in a meter with 50 previous values channels, there are 8 channels in each of block 1 to block 6 and 2 channels in block 7 .

The registers of unused channels are filled with 0xFFFF.

Structure of the data blocks

The following table describes the structure of the data blocks:

| Channel | Contents | Start <br> Reg <br> (Hex) | Size | Description |
| :--- | :--- | :--- | :--- | :--- |
| Common for <br> all channels | Timestamp | 8010 | 3 | Date and time for the end if this period, <br> i.e. when this entry was stored. (Date/ <br> Time format) |
| Channel 1 | Quantity | 8013 | 3 | OBIS code for the quantity stored in <br> channel 1. |
| Channel 1 | Data type | 8016 | 1 | Data type for quantity stored in channel <br> 1. |
| Channel 1 | Scaler | 8017 | 1 | Scaler for quantity stored in channel 1. |
| Channel 1 | Status | 8018 | 1 | Status for quantity stored in channel 1. |
| Channel 1 | Value | 8019 | 4 | Value for quantity stored in channel 1. |
| $\ldots$ |  |  |  |  |
| $\ldots$ | Quantity | 8059 | 3 | OBIS code for the quantity stored in <br> channel 8. |
| Channel 8 | Data type | 805 C | 1 | Data type for quantity stored in channel <br> 8. |
| Channel 8 | Scaler | 805 D | 1 | Scaler for quantity stored in channel 8. |
| Channel 8 | Schan |  | 805 E | 1 |
| Channel 8 | Status | 805 F | 4 | Value for quantity stored in channel 8. |
| Channel 8 | Value |  |  |  |

The status register shows the status for a value stored at a given timestamp. Possible values are shown in the table below:

| Status | Description |
| :--- | :--- |
| 0 | OK |
| 1 | Not available |
| 2 | Data error |

## Example of data block 1 <br> The following table shows the relation between stored values and channels in data block 1:

| Entry | Timestamp | Channel 1 |  | Channel 2..8 |
| :--- | :--- | :--- | :--- | :--- |
|  |  | Status | Value |  |
| 1 | 110601 <br> $00: 00: 00$ | $0(\mathrm{OK})$ | 1000 kWh | $\ldots$ |
| 2 | 110501 <br> $00: 00: 00$ | $0(\mathrm{OK})$ | 800 kWh | $\ldots$ |
| 3 | 110401 <br> $00: 00: 00$ | $0(\mathrm{OK})$ | 450 kWh | $\ldots$ |

### 9.5.1 Reading Previous Values

## General

## Read the most

 recentRead the entire history

Readout of previous values is controlled by the Entry number register or Date/ Time register.

After writing to any of those registers, the values of all channels for the given entry number or date/time are available in the registers of data block 1 to 7, together with status and timestamp information.
In the data blocks, the registers Quantity, Data type and Scaler provide further information about the data stored in each channel. To get the next block of previous values, write the value 1 to the Get next entry register, and then read again from the registers in the data blocks.

Follow the steps in the table below to read the most recent previous values entry:

| Step | Action |
| :--- | :--- |
| 1 | Write the value 1 to the entry number register. |
| 2 | Read the data blocks of interest. |

Follow the steps in the table below to read the entire history of previous values:

| Step | Action |
| :--- | :--- |
| 1 | Write the value 0 to the Entry number register to make sure the reading starts <br> from the most recent entry. |
| 2 | Write the value 1 to the Get next entry register. |
| 3 | Read the data blocks of interest. |
| 4 | Repeat steps 2 and 3 until there are no more entries stored. When all entries <br> have been read, all registers in the data blocks are set to 0xFFFF. |

Note - The entry number register is reset to 0 after a restart.

Read forward or backwards from a specified date/ time

Follow the steps in the table below to read forward or backwards in time from a specified date/time:

| Step | Action |
| :--- | :--- |
| 1 | Write a date and time to the Date/Time registers. |
| 2 | Write to the Direction register. Writing value 0 means backwards and value 1 <br> means forward. |
| 3 | Read the data blocks of interest. |
| 4 | Write the value 1 to the Get next entry register. |
| 5 | Repeat steps 3 and 4 until there are no more entries stored. When all entries <br> have been read, all registers in the data blocks are set to 0xFFFF. |

Note - The Date/time registers are reset to 0xFFFF after a restart.

### 9.6 Demand

Note - Before you can use the information in this chapter you must be familiar with and understand the information and the concepts described in "Historical Data" on page - 109.

## Mapping table

## Header

## Data blocks

The following table shows an overview of the mapping table:

| Function | Details | Start Reg <br> $($ Hex) | Size |
| :--- | :--- | :--- | :--- |
| Demand | Header | 8300 | 16 |
| Demand | Data block 1 | 8310 | 115 |
| Demand | Data block 2 | 8390 | 115 |
| Demand | Data block 3 | 8410 | 115 |
| Demand | Data block 4 | 8490 | 115 |
| Demand | Data block 5 | 8510 | 115 |
| Demand | Data block 6 | 8590 | 115 |
| Demand | Data block 7 | 8610 | 115 |

The following table describes the header:

| Function | Start <br> Reg <br> (Hex) | Size | Description | Read/ <br> write |
| :--- | :--- | :--- | :--- | :--- |
| Get next entry | 8300 | 1 | Write value 1 to this register to load the <br> next block of values and timestamp | R/W |
| Entry number | 8301 | 1 | Write to this register to choose an entry <br> number to start reading from | R/W |
| Date/Time | 8304 | 3 | Write to this register to choose a date/time <br> to start reading from | R/W |
| Direction | 8307 | 1 | Write to this register to choose the direc- <br> ton of reading | R/W |

The Data blocks contain the history of demand. Data block 1 to 7 have the same structure. Each block can contain up to 8 channels. Consequently, in a meter with 50 demand channels, there are 8 channels in each of block 1 to block 6 and 2 channels in block 7 .

The registers of unused channels are filled with 0xFFFF.

## Structure of the

 data blocksThe following table describes the structure of the data blocks:

| Channel | Contents | Start <br> Reg <br> (Hex) | Size | Description |
| :--- | :--- | :--- | :--- | :--- |
| Common for <br> all channels | Timestamp | 8310 | 3 | Date and time for the end if this period, i.e. <br> when this entry was stored. (Date/Time <br> format) |
| Channel 1 | Quantity | 8313 | 3 | OBIS code for the quantity monitored in <br> channel 1. |
| Channel 1 | Level | 8316 | 1 | Demand level for channel 1. |
| Channel 1 | Data type | 8317 | 1 | Data type for quantity monitored in chan- <br> nel 1. |
| Channel 1 | Scaler | 8318 | 1 | Scaler for quantity monitored in channel 1. |
| Channel 1 | Capture time | 8319 | 3 | Date and time when the minimum or max- <br> imum occurred for the quantity monitored <br> in channel 1. |
| Channel 1 | Status | 831 C | 1 | Status for quantity monitored in channel 1. |
| Channel 1 | Value | 831 D | 4 | Value for quantity monitored in channel 1. |
| $\ldots$ |  |  |  |  |
| $\ldots$ | Channel 8 | Quantity | 836 C | 3 |
| Chans code for the quantity monitored in |  |  |  |  |
| Channel 8. |  |  |  |  |

The Level register shows which demand level is configured for this channel. Possible values are shown in the table below:

| Value | Description |
| :--- | :--- |
| 1 | Highest/Lowest value during the demand period |
| 2 | Second highest/lowest value during the demand period |

| Value | Description |
| :--- | :--- |
| 3 | Third highest/lowest value during the demand period |

## Capture time register

## Status register

## Example of data

 block 1The Capture time register shows the date and time when the minimum or maximum value for this entry occurred.

The status register shows the status for a value stored at a given timestamp. Possible values are shown in the table below:

| Status | Description |
| :--- | :--- |
| 0 | OK |
| 1 | Not available |
| 2 | Data error |

The following table shows the relation between stored values and channels in data block 1:

| Entry | Timestamp | Channel 1 |  |  | Channel 2..8 |
| :--- | :--- | :--- | :--- | :--- | :--- |
|  |  | Capture time | Status | Value |  |
| 1 | 110601 <br> $00: 00: 00$ | 110515 <br> $01: 05: 00$ | 0 (OK) | 200 W | $\ldots$ |
| 2 | 110501 <br> $00: 00: 00$ | 110410 <br> $02: 10: 00$ | 2 (Data error) | 10000 W | $\ldots$ |
| 3 | 110401 <br> $00: 00: 00$ | 110305 <br> $03: 15: 00$ | 0 (OK) | 250 W | $\ldots$ |

### 9.6.1 Reading Demand

## General

Readout of demand is controlled by the Entry number register or Date/Time register.

After writing to any of those registers, the values of all channels for the given entry number or date/time are available in the registers of data block 1 to 7 , together with status and timestamp information.

In the data blocks, the registers Quantity, Level, Data type and Scaler provide further information about the data stored in each channel. To get the next block of demand values, write the value 1 to the Get next entry register, and then read again from the registers in the data blocks.

Read the most recent

Follow the steps in the table below to read the most recent demand entry:

| Step | Action |
| :--- | :--- |
| 1 | Write the value 1 to the entry number register. |
| 2 | Read the data blocks of interest. |

## Read the entire

 historyFollow the steps in the table below to read the entire history of previous values:

| Step | Action |
| :--- | :--- |
| 1 | Write the value 0 to the Entry number register to make sure the reading starts <br> from the most recent entry. |
| 2 | Write the value 1 to the Get next entry register. |
| 3 | Read the data blocks of interest. |
| 4 | Repeat steps 3 and 4 until there are no more entries stored. When all entries <br> have been read, all registers in the data blocks are set to 0xFFFF. |

Note - The entry number register is reset to 0 after a restart.

Read forward or backwards from a specified date/ time

Follow the steps in the table below to read forward or backwards in time from a specified date/time:

| Step | Action |
| :--- | :--- |
| 1 | Write a date and time to the Date/Time registers. |
| 2 | Write to the Direction register. Writing value 0 means backwards and value 1 <br> means forward. |
| 3 | Read the data blocks of interest. |
| 4 | Write the value 1 to the Get next entry register. |
| 5 | Repeat steps 3 and 4 until there are no more entries stored. When all entries <br> have been read, all registers in the data blocks are set to 0xFFFF. |

Note - The Date/time registers are reset to 0xFFFF after a restart.

### 9.7 Event logs

Note - Before you can use the information in this chapter you must be familiar with and understand the information and the concepts described in "Historical Data" on page - 109.

## Mapping table

## Header and data block

## Structure of the

 headerThe following table shows an overview of the mapping table:

| Log type | Details | Start Reg (Hex) | Size |
| :--- | :--- | :--- | :--- |
| System log | Header | 6500 | 16 |
| System log | Data block | 6510 | 105 |
| Event log | Header | $65 \mathrm{B0}$ | 16 |
| Event log | Data block | 65 C 0 | 105 |
| Audit log | Header | 6660 | 16 |
| Audit log | Data block | 6670 | 105 |
| Net quality log | Header | 6710 | 16 |
| Net quality log | Data block | 6720 | 105 |
| Communication log | Header | 67 C 0 | 16 |
| Communication log | Data block | 67 D 0 | 105 |

There is one pair of header and data block for each log type, located in the registers listed in the mapping table above. In the tables showing the structure of the header and data block below the register numbers are valid for the System log. However the headers and data blocks for all log types share the same structure, so the tables are applicable for all log types if the register numbers are exchanged to correct values.

The following table describes the header:

| Function | Start <br> Reg <br> (Hex) | Size | Description | Read/write |
| :--- | :--- | :--- | :--- | :--- |
| Get next block | 6500 | 1 | Write value 1 to this register to load <br> the next block of log entries | R/W |
| Entry number | 6501 | 1 | Write to this register to choose an <br> entry number to start reading from | R/W |
| Date/Time | 6504 | 3 | Write to this register to choose a <br> date/time to start reading from | R/W |
| Direction | 6507 | 1 | Write to this register to choose the <br> direction of reading | R/W |

## Data block

## Structure of the

 data blockThe data block contains the log entries, consisting of timestamp, event counter, event category, event id and duration. There is space for up to $15 \log$ entries in the data block. The $\log$ is read by repeatedly loading new values into the data block in backward or forward direction in time.

The event appearing in the first position in the data block has the entry number indicated by Entry number register. In case of backwards reading the events in the other positions follow in ascending entry number order, i.e. going towards older events. In case of forward reading the events in the other positions follow in descending entry number order, i.e. going towards more recent events.

The following table describes the structure of the data block:

| Entry <br> position | Contents | Start <br> Reg <br> (Hex) | Size | Description |
| :--- | :--- | :--- | :--- | :--- |
| 1 | Timestamp | 6510 | 3 | Date and time when the event occur ed <br> (Date/Time format) |
| 1 | Category | 6513 | 1 | The category of this log entry (exception, <br> warning, error or information). |
| 1 | Event id | 6514 | 1 | The id for this log entry, identifying what <br> has happened. |
| $\ldots$ | Duration | 6515 | 2 | The duration of this event measured in <br> seconds. |
| $\ldots$ | Timestamp | 6572 | 3 | Date and time when the event occur ed <br> (Date/Time format) |
| 15 | Category | 6575 | 1 | The category of this log entry (exception, <br> warning, error or information). |
| 15 | Event id | 6576 | 1 | The id for this log entry, identifying what <br> has happened. |
| 15 | Duration | 6577 | 2 | The duration of this event measured in <br> seconds. |
| 15 |  |  |  |  |

Possible values for the category register are shown in the table below:

| Category | Description |
| :--- | :--- |
| 1 | Exception |
| 2 | Error |

| Category | Description |
| :--- | :--- |
| 4 | Warning |
| 8 | Information |

### 9.7.1 Reading Event logs

General Readout of logs is controlled by the Entry number register or the Date/Time register. After writing to the Entry number register or the Date/Time register, the log entries are available in the registers of the data block. To get the next set of entries the Get next entry register is used.

## Read the 15 most

 recent logsFollow the steps in the table below to read the 15 most recent log entries:

| Step | Action |
| :--- | :--- |
| 1 | Write the value 1 to the entry number register. |
| 2 | Read the data block. |

## Read the entire history <br> Follow the steps in the table below to read the entire history of logs, backwards in time:

| Step | Action |
| :--- | :--- |
| 1 | Write the value 0 to the Entry number register to make sure the reading starts <br> from the most recent entry. |
| 2 | Write the value 1 to the Get next entry register. |
| 3 | Read the data block. <br> First time this step is performed the logs in the data block are the most recent <br> up to the 15th most recent. Second time this step is performed the logs in the <br> data block are the 16th to the 30th. |
| 4 | Repeat steps 2 and 3 until there are no more entries stored. When all entries <br> have been read, all registers in the data block are set to 0xFFFF. |

Note - The entry number register is reset to 0 after a restart.

Read forward or backwards from a specified date/ time

Follow the steps in the table below to read forward or backwards in time from a specified date/time:

| Step | Action |
| :--- | :--- |
| 1 | Write a date and time to the Date/Time registers. |
| 2 | Write to the Direction register. Writing value 0 means backwards and value 1 <br> means forward. |
| 3 | Read data block. |
| 4 | Write the value 1 to the Get next entry register. |

| Step | Action |
| :--- | :--- |
| 5 | Repeat steps 3 and 4 until there are no more entries stored. When all entries <br> have been read, all registers in the data block are set to 0xFFFF. |

Note - The Date/time registers are reset to 0xFFFF after a restart.

### 9.8 Load profile

## Mapping table

## Structure of the header

Structure of the channel information

Note - Before you can use the information in this chapter you must be familiar with and understand the information and the concepts described in "Historical Data" on page - 109 .

The following table shows an overview of the mapping table:

| Quantity | Details | Start Reg (Hex) | Size |
| :--- | :--- | :--- | :--- |
| Load profile | Header | 8700 | 16 |
| Load profile | Channel information | 8710 | 7 |
| Load profile | Data block | 8720 | 120 |

The following table describes the header:

| Function | Start <br> Reg <br> (Hex) | Size | Description | Read/write |
| :--- | :--- | :--- | :--- | :--- |
| Get next block | 8700 | 1 | Write value 1 to this register to load <br> the next block of load profile entries | R/W |
| Channel number | 8703 | 1 | Write to this register to choose a <br> load profile channel. Possible values <br> are 1-8. | R/W |
| Date/Time | 8704 | 3 | Write to this register to choose a <br> date/time to start reading from | R/W |
| Direction | 8707 | 1 | Write to this register to choose the <br> direction of reading | R/W |

The following table describes the channel information registers:

| Function | Start <br> Reg <br> (Hex) | Size | Description | Read/write |
| :--- | :--- | :--- | :--- | :--- |
| Quantity | 8710 | 3 | OBIS code for the quantity stored in <br> this channel | R/W |
| Scaler | 8713 | 1 | Scaling of the values stored in this <br> channel | R/W |
| Interval | 8714 | 2 | Interval with which values are stored <br> in this channel. Expressed in min- <br> utes. | R/W |
| Data type | 8716 | 1 | Data type of the values stored in this <br> channel | R/W |

## Data block

Structure of the data block

The data block contains the load profile entries, consisting of timestamp, status and value. There is space for up to 15 entries in the data block. The load profile is read by repeatedly loading new values into the data block in backward or forward direction in time.

In case of backwards reading the entries in the data block are placed in ascending entry number order, i.e. going towards older entries. In case of forward reading the entries are placed in descending entry number order, i.e. going towards more recent entries.

The following table describes the structure of the data block:

| Entry <br> position | Contents | Start <br> Reg <br> (Hex) | Size | Description |
| :--- | :--- | :--- | :--- | :--- |
| 1 | Timestamp | 8720 | 3 | Date and time when the entry was <br> stored. (Date/Time format) |
| 1 | Status | 8723 | 1 | The status for this entry |
| 1 | Value | 8724 | 4 | The value for this entry |
| $\ldots$ |  |  |  |  |
| $\ldots$ |  |  |  |  |
| 15 | Timestamp | 8789 | 3 | Date and time when the entry was <br> stored. (Date/Time format) |
| 15 | Status | 8792 | 1 | The status for this entry |
| 15 | Value | 8793 | 4 | The value for this entry |

## Status register

The status register holds status information for a load profile entry.

The following table describes the meaning of the individual bits in the status register:

| Bit <br> number | Contents | Description |
| :--- | :--- | :--- |
| 0 | Entry available | This bit is set if the value register con- <br> tains a valid value |
| 1 | Restart | This bit is set if a restart occur ed during <br> the interval |
| 2 | Interval long | This bit is set if the interval was longer <br> than the configured interval. This hap- <br> pens if the date and time have been ad- <br> justed backwards in time. |

| Bit <br> number | Contents | Description |
| :--- | :--- | :--- |
| 3 | Interval short | This bit is set if the interval was shorter <br> than the configured interval. This hap- <br> pens if the date and time have been ad- <br> justed forward in time. |
| 4 | Time change | This bit is set if an adjustment to the date <br> and time was made during the interval |
| 5 | Bad value | This bit is set if the value register con- <br> thins a doubtful value |
| $6-7$ | Not used |  |

Note - Bit 0 in the table above refers to the least significant bit in the register.

### 9.8.1 Reading Load profile

General Readout of load profile is controlled by the Date/Time register. After writing to the Date/Time register, the load profile entries are available in the registers of the data block. To get the next set of entries the Get next entry register is used.

Read the 15 most
Follow the steps in the table below to read the 15 most recent load profile entries: recent entries

| Step | Action |
| :--- | :--- |
| 1 | Write a date and time in the future to the Date/Time registers, e.g. 2099-01-01 <br> $00: 00: 00$. |
| 2 | Write the value 0 to the Direction register. |
| 3 | Read the data block. |

## Read forward or

 backwards from a specified dated timeFollow the steps in the table below to read forward or backwards in time from a specified date/time:

| Step | Action |
| :--- | :--- |
| 1 | Write a date and time to the Date/Time registers. |
| 2 | Write to the Direction register. Writing value 0 means backwards and value 1 <br> means forward. |
| 3 | Read data block. |
| 4 | Write the value 1 to the Get next entry register. |
| 5 | Repeat steps 3 and 4 until there are no more entries stored. When all entries <br> have been read, all registers in the data block are set to 0xFFFF. |

Note - The Date/time registers are reset to 0xFFFF after a restart.

### 9.9 Configuration

## Introduction

This section describes how to configure the following functions:

- Previous values
- Demand
- Load profile
- Alarms
- I/O
- Tariffs

### 9.9.1 Previous values

General Previous values configuration defines the set of quantities to store at the end of a period. It is also defines the period with which values are stored.

## Mapping table

Quantity configuration registers

The following table describes the group of registers for configuring quantities to store in previous values:

| Function | Start <br> Reg <br> (Hex) | Size | Description | Read/ <br> write |
| :--- | :--- | :--- | :--- | :--- |
| Number of chan- <br> nels | 8 C50 | 1 | The number of channels used (up to a <br> maximum of 50) | R/W |
| Channel number | 8 C 51 | 1 | Current channel number during read or <br> write of configuration | R |
| Quantity | 8 C 52 | 3 | OBIS code for the quantity in this chan- <br> nel | R/W |

Write quantity configuration

Follow the steps in the table below to configure the set of quantities to store in previous values:

| Step | Action |
| :--- | :--- |
| 1 | Write the number of channels that shall be configured to the Number of chan- <br> nels register. This is a value between 1 and 50. |

| Step | Action |
| :--- | :--- |
| 2 | Write the OBIS code for the quantity to store in the first channel to the Quantity <br> registers. |
| 3 | Repeat step 2 for all channels that shall be used, i.e. the same number of times <br> as the value written in step 1. |

## Read quantity

 configurationFollow the steps in the table below to read the current configuration of quantities to store in previous values:

| Step | Action |
| :--- | :--- |
| 1 | Read the Number of channels register to find out how many channels are used. |
| 2 | Read from the Quantity registers to get the OBIS code for the quantity config- <br> red in the first channel. |
| 3 | Repeat step 2 for each channel, until all OBIS codes have been read. This <br> means step 2 shall be performed the same number of times as the value read <br> from the Number of channels register |

Note - Step 1 initiates the readout procedure and can NOT be left out, even if the number of channels used is already known.

Note - The Channel number register can optionally be read together with the Quantity registers in step 2. The Channel number register holds the current channel number, starting from 1 after reading the Number of channels register. It is incremented every time the Quantity registers are read.

## Period

configuration register

The Period configuration register is used to read or write the period with which previous values are stored. The table below describes the contents of the Period configuration register:

| Byte nr | Description | Possible values |
| :--- | :--- | :--- |
| 0 (High byte) | Previous values period | $0=$ Daily <br> $1=$ Weekly <br> $2=$ Monthly |
| 1 (Low byte) | Day of week, in case of weekly storage | $1-7$ (1 = Monday) |

### 9.9.2 Demand

General | Demand configuration defines the set of quantities to store at the end of a period |
| :--- |
| and the number of levels for these quantities. It is also defines the period with |
| which values are stored, and the intervals for calculation of minimum and maxi- |
| mum values. | $\quad$.

## Mapping table

Quantity configuration registers

Write quantity configuration

Read quantity configuration

The following table shows an overview of the mapping table:

| Quantity | Details | Start Reg (Hex) | Size |
| :--- | :--- | :--- | :--- |
| Demand | Quantity configuration | 8 C 30 | 5 |
| Demand | Level configuration | 8 C 35 | 4 |
| Demand | Interval configuration | 8 C 39 | 1 |
| Demand | Sub interval configuration | 8 C 3 A | 1 |
| Demand | Period configuration | 8 C 3 B | 1 |

The following table describes the group of registers for configuring quantities to store in demand:

| Function | Start <br> Reg <br> (Hex) | Size | Description | Read/ <br> write |
| :--- | :--- | :--- | :--- | :--- |
| Number of quan- <br> tities | 8 C 30 | 1 | The number of quantities to store in De- <br> mand (up to a maximum of 50) | $\mathrm{R} / \mathrm{W}$ |
| Quantity number | 8 C 31 | 1 | Current quantity number during read or <br> write of configuration | R |
| Quantity | 8 C 32 | 3 | OBIS code for the quantity | R/W |

Follow the steps in the table below to configure the set of quantities to store in demand:

| Step | Action |
| :--- | :--- |
| 1 | Write the number of quantities that shall be configured to the Number of quan- <br> tities register. This is a value between 1 and 50. |
| 2 | Write the OBIS code for the first quantity to the Quantity registers. |
| 3 | Repeat step 2 for all quantities that shall be used, i.e. the same number of times <br> as the value written in step 1. |

Follow the steps in the table below to read the current configuration of quantities to store in demand:

| Step | Action |
| :--- | :--- |
| 1 | Read the Number of quantities register to find out how many quantities are <br> used. |
| 2 | Read from the Quantity registers to get the OBIS code for the first quantity. |
| 3 | Repeat step 2 for each quantity, until all OBIS codes have been read. This <br> means step 2 shall be performed the same number of times as the value read <br> from the Number of quantities register |

Note - Step 1 initiates the readout procedure and can NOT be left out, even if the number of quantities used is already known.

Note - The Quantity number register can optionally be read together with the Quantity registers in step 2. The Quantity number register holds the current quantity number, starting from 1 after reading the Number of quantities register. It is incremented every time the Quantity registers are read.

## Level <br> configuration registers

The following table describes the group of registers for configuring the number of levels for all quantities stored in demand:

| Function | Start <br> Reg <br> (Hex) | Size | Description | Read/ <br> write |
| :--- | :--- | :--- | :--- | :--- |
| Level quantity | 8 C 35 | 3 | OBIS code for the quantity | R/W |
| Number of levels | 8 C 38 | 1 | Number of levels to store for the quantity | R/W |

Follow the steps in the table below to configure the number of levels for each of the quantities stored in demand:

| Step | Action |
| :--- | :--- |
| 1 | Write the OBIS code for the first quantity to the Level quantity registers. |
| 2 | Write the number of levels to use for the quantity chosen in step 1 to the Num- <br> ber of levels register. Allowed values are 1-3. |
| 3 | Repeat step 1 and 2 for all quantities used in demand. |

## Read level configuration

Note - It is assumed that the set of quantities, ie. the OBIS codes, to store in demand has already been configured by performing the steps under Write quantity configuration. Writing an OBIS code in step 1 above does NOT add it to the set of quantities to store.

Follow the steps in the table below to read the current configuration of levels for all quantities stored in demand:

| Step | Action |
| :--- | :--- |
| 1 | Write the OBIS code for the first quantity to the Level quantity registers. |
| 2 | Read the number of levels used for the quantity chosen in step 1 from the Num- <br> beer of levels register. |
| 3 | Repeat step 1 and 2 for all quantities used in demand. |

Note - It is assumed that the set of quantities, ie. the OBIS codes, stored in demand is already known. Otherwise the steps under Read quantity configuration must be performed first to find these.

## Interval configuration register

The Interval configuration register is used to read or write the length of the period with which average values are calculated. The interval is expressed in minutes.

## Sub interval configuration register

The Sub interval configuration register is used to read or write the length of the short period in case of sliding demand. The sub interval is expressed in minutes.

## Period configuration register

The Period configuration register is used to read or write the period with which demand values are stored. The table below describes the contents of the Period configuration register:

| Byte nr | Description | Possible values |
| :--- | :--- | :--- |
| 0 (High byte) | Demand period | $0=$ Daily <br> $1=$ Weekly <br> $2=$ Monthly |
| 1 (Low byte) | Day of week, in case of weekly storage | $1-7(1=$ Monday) |

### 9.9.3 Load profile

## General

## Mapping table

The following table shows the registers used for load profile configuration:

| Quantity | Details | Start Reg (Hex) | Size |
| :--- | :--- | :--- | :--- |
| Load profile | Channel number | 8 C 20 | 1 |
| Load profile | Quantity | 8 C 21 | 3 |
| Load profile | Interval | 8 C 24 | 2 |
| Load profile | Max number of snapshots | 8 C 26 | 2 |

Load profile configuration defines the quantity to store for each channel. It is also defines the interval by which values are stored and the maximum number of snapshots. All settings are individual for every channel.

| Step | Action |
| :--- | :--- |
| 2 | Write the OBIS code for the quantity to store in the chosen channel to the <br> Quantity registers. |
| 3 | Write the desired storing interval to the Interval registers. The interval is ex- <br> pressed in minutes. |
| 4 | Write the desired maximum number of snapshots to the Max number of snap- <br> shots registers. |
| 5 | Repeat steps 1 to 4 for all channels. |

## Read channel configuration

Follow the steps in the table below to read the current configuration of the load profile channels:

| Step | Action |
| :--- | :--- |
| 1 | Choose the channel to read configuration for by writing a number to the Chan- <br> nel number register. Allowed values are 1-8. |
| 2 | Read from the Quantity registers to get the OBIS code for the quantity config- <br> ured in the chosen channel. |
| 3 | Read from the Interval registers to get the storing interval for the chosen chan- <br> nel. The interval is expressed in minutes. |
| 4 | Read from the Max number of snapshots registers to get the maximum number <br> of snapshots that can be stored in the chosen channel. |
| 5 | Repeat steps 1 to 4 for all channels. |

### 9.9.4 Alarms

General Alarm configuration defines the set of quantities to monitor. It is also defines the threshold values, delays and actions to perform for each alarm. Each alarm is configured individually.

## Alarm configuration registers

The following table describes the group of registers for configuring the alarm parameters:

| Function | Start <br> Reg <br> (Hex) | Size | Description | Read/ <br> write |
| :--- | :--- | :--- | :--- | :--- |
| Alarm number | 8 C 60 | 1 | The number (identifier) for the alarm to <br> configure | R/W |
| Quantity | 8 C 61 | 3 | The quantity to monitor | R/W |
| Thresholds | 8 C 64 | 8 | ON and OFF thresholds to used to de- <br> cide when the alarm is active | R/W |

| Function | Start <br> Reg <br> (Hex) | Size | Description | Read/ <br> write |
| :--- | :--- | :--- | :--- | :--- |
| Delays | 8C6C | 4 | ON and OFF delays, defining the time <br> that the measured value must be above/ <br> below the configured thresholds before <br> the alarm triggers | R/W |
| Actions | 8 C 70 | 2 | Actions to perform when alarm is trig- <br> gered | R/W |

## Quantity identifiers

The following table lists the OBIS codes for the quantities that can be monitored by an alarm:

| Quantity | OBIS code |
| :--- | :--- |
| Voltage L1 | 1.0 .32 .7 .0 .255 |
| Voltage L2 | 1.0 .52 .7 .0 .255 |
| Voltage L3 | 1.0 .72 .7 .0 .255 |
| Voltage L1-L2 | 1.0 .134 .7 .0 .255 |
| Voltage L2-L3 | 1.0 .135 .7 .0 .255 |
| Voltage L1-L3 | 1.0 .136 .7 .0 .255 |
| Current L1 | 1.0 .31 .7 .0 .255 |
| Current L2 | 1.0 .51 .7 .0 .255 |
| Current L3 | 1.0 .71 .7 .0 .255 |
| Current N | 1.0 .91 .7 .0 .255 |
| Active power total | 1.0 .16 .7 .0 .255 |
| Active power L1 | 1.0 .36 .7 .0 .255 |
| Active power L2 | 1.0 .56 .7 .0 .255 |
| Active power L3 | 1.0 .76 .7 .0 .255 |
| Reactive power total | 1.0 .128 .7 .0 .255 |
| Reactive power L1 | 1.0 .129 .7 .0 .255 |
| Reactive power L2 | 1.0 .130 .7 .0 .255 |
| Reactive power L3 | 1.0 .131 .7 .0 .255 |
| Apparent power total | 1.0 .137 .7 .0 .255 |
| Apparent power L1 | 1.0 .138 .7 .0 .255 |
| Apparent power L2 | 1.0 .139 .7 .0 .255 |

| Quantity | OBIS code |
| :--- | :--- |
| Apparent power L3 | 1.0 .140 .7 .0 .255 |
| Power factor total | 1.0 .13 .7 .0 .255 |
| Power factor L1 | 1.0 .33 .7 .0 .255 |
| Power factor L2 | 1.0 .53 .7 .0 .255 |
| Power factor L3 | 1.0 .73 .7 .0 .255 |
| Harmonic voltage L1 | 1.0 .32 .7 .0 .255 |
| Harmonic voltage L2 | 1.0 .52 .7 .0 .255 |
| Harmonic voltage L3 | 1.0 .72 .7 .0 .255 |
| Harmonic voltage L1-L2 | 1.0 .134 .7 .0 .255 |
| Harmonic voltage L2-L3 | 1.0 .135 .7 .0 .255 |
| Harmonic voltage L1-L3 | 1.0 .136 .7 .0 .255 |
| Harmonic current L1 | 1.0 .31 .7 .0 .255 |
| Harmonic current L2 | 1.0 .51 .7 .0 .255 |
| Harmonic current L3 | 1.0 .71 .7 .0 .255 |
| Harmonic current Neutral | 1.0 .91 .7 .0 .255 |
| Inactive (deactivates the alarm) | 1.128 .128 .128 .128 .128 |

## Thresholds registers

The Thresholds registers are used to read and write the ON and OFF threshold values for an alarm. The scaling is the same as where the quantity appears in the normal mapping tables. The first (lowest) 4 registers are the ON threshold and the last 4 registers are the OFF threshold. Data type is signed 64 bit integer.

The Delays registers are used to read or write the ON and OFF delays for an alarm. The delay is expressed in milliseconds. The first (lowest) 2 registers are the ON delay and the last 2 registers are the OFF delay. Data type is unsigned 32 bit integer.

## Actions registers

The Actions registers are used to read or write the actions to be performed when an alarm triggers. The first (lowest) register holds the actions to perform. The
second register holds the number of the output to set, in case Set output action is used.

| Register nr (Hex) | Bit number | Description | Possible values |
| :--- | :--- | :--- | :--- |
| $8 \mathrm{BC72}$ | 0 <br> (least significant <br> bit) | Write entry to log | $1=$ use this action <br> $0=$ don't use |
|  | 1 | Set output | $1=$ use this action <br> $0=$ don't use |
|  | 2 | Set bit in alarm register | $1=$ use this action <br> $0=$ don't use |
| 8 C 73 | $3-15$ | Not used |  |
|  | (Entire register) | Number of the output to <br> turn on. Ignored if Set out- <br> put bit above is set to 0. | $1-4$ |

Note - Both registers in the table above must be written in one operation, otherwise the value will not take effect.

## Write alarm configuration

Follow the steps in the table below to configure the parameters for monitoring the value of a number of quantities in the meter:

| Step | Action |
| :--- | :--- |
| 1 | Write the number of the alarm to configure to the Alarm number register. This <br> is a value between 1 and 25. |
| 2 | Write the OBIS code for the quantity to monitor to the Quantity registers. |
| 3 | Write the ON and OFF thresholds to the Thresholds registers. |
| 4 | Write the ON and OFF delays to the Delays registers. |
| 5 | Write the actions to perform to perform to the Action registers. |
| 6 | Repeat step 1 to 4 for all alarms that shall be used. |

## Read alarm

 configurationFollow the steps in the table below to read the current configuration of monitoring parameters for alarms.

| Step | Action |
| :--- | :--- |
| 1 | Write the number of the alarm to read configuration for to the Alarm number <br> register. This is a value between 1 and 25. |
| 2 | Read the Quantity registers to get the quantity monitored in the chosen alarm. |
| 3 | Read the Thresholds registers to get the ON and OFF thresholds. |
| 4 | Read the Delays registers to get the ON and OFF delays. |
| 5 | Read the Action registers to get the actions performed when an alarm is trig- <br> gered. |

| Step | Action |
| :--- | :--- |
| 6 | Repeat step 1 to 4 for all alarms. |

### 9.9.5 Inputs and outputs

## General

## Mapping table

## I/O port

 configuration registersInputs and outputs configuration defines the function for each physical I/O port. It also defines the parameters for the logical pulse outputs.

The following table shows an overview of the mapping table:

| Quantity | Details | Start Reg (Hex) | Size |
| :--- | :--- | :--- | :--- |
| Inputs and outputs | I/O port configuration | 8 C 0 C | 4 |
| Inputs and outputs | Pulse output configuration | 8 C 10 | 12 |

The following table describes the group of registers for configuring the function for physical I/O ports:

| Register | Start <br> Reg <br> (Hex) | Size | Description | Read/ <br> write |
| :--- | :--- | :--- | :--- | :--- |
| I/O port 1 | 8C0C | 1 | Function of first I/O port | R/W |
| I/O port 2 | 8C0D | 1 | Function of second I/O port | R/W |
| I/O port 3 | $8 C 0 E$ | 1 | Function of third I/O port | R/W |
| I/O port 4 | 8C0F | 1 | Function of fourth I/O port | R/W |

The following table lists the possible values for I/O port function:

| Value | Function |
| :--- | :--- |
| 0 | Input |
| 1 | Communication output |
| 2 | Alarm output |
| 3 | Pulse output |
| 4 | Tariff output |
| 5 | Output always ON |
| 6 | Output always OFF |

## Pulse output configuration registers

The following table describes the group of registers for configuring the pulse outputs:

| Function | Start <br> Reg <br> (Hex) | Size | Description | Read/ <br> write |
| :--- | :--- | :--- | :--- | :--- |
| Pulse output in- <br> stance | 8 C 10 | 1 | The instance number of the pulse output | R/W |
| Port number | 8 C 11 | 1 | The physical I/O port on which the <br> pulses are sent out | R/W |
| Energy quantity | 8 C 12 | 3 | The OBIS code for the quantity | R/W |
| Pulse frequency <br> active energy | 8 C 15 | 2 | The pulse frequency, measured in <br> pulses/kWh with 3 decimals. This is rele- <br> vant only if Energy quantity is set to ac- <br> tive energy. | R/W |
| Pulse frequency <br> reactive energy | 8 C 17 | 2 | The pulse frequency, measured in <br> pulses/kvarh with 3 decimals. This is rel- <br> evant only if Energy quantity is set to re- <br> active energy. | R/W |
| Pulse length | 8 C 19 | 2 | The duration of a pulse, measured in mil- <br> liseconds | R/W |
| Turn off pulse <br> output | 8 C 1 B | 1 | Write the value 1 to this register to turn <br> off the chosen pulse output instance | R/W |

Selectable energy The table below lists the possible energy quantities to associate with a pulse outquantities put:

| Quantity | OBIS code |
| :--- | :--- |
| Active energy import total | 1.0 .1 .8 .0 .255 |
| Active energy export total | 1.0 .2 .8 .0 .255 |
| Reactive energy import total | 1.0 .3 .8 .0 .255 |
| Reactive energy export total | 1.0 .4 .8 .0 .255 |

| Write pulse output configuration | Follow the steps in the table below to configure the pulse outputs: |  |
| :---: | :---: | :---: |
|  | Step | Action |
|  | 1 | Choose the pulse output instance to configure by writing a number to the Pulse output instance register. Allowed values are 1-4. |
|  | 2 | Write to the Port number register to decide to which physical port the pulses are sent out for the chosen pulse output. Allowed values are 0-4, where 0 means No Output. |
|  | 3 | Write the OBIS code of the quantity that shall be used for the chosen pulse out put to the Energy quantity registers. Possible OBIS codes are listed above. |

Turn off a pulse output

Read pulse output configuration

| Step | Action |
| :--- | :--- |
| 4 | Write the desired pulse frequency to the Pulse frequency active or reactive en- <br> ergy registers, depending on the chosen energy type. |
| 5 | Write the desired pulse length to the Pulse length registers. |
| 6 | Repeat steps 1 to 5 for all pulse outputs. |

Follow the steps in the table below to turn off a pulse output instance:

| Step | Action |
| :--- | :--- |
| 1 | Choose the pulse output instance to configure by writing a number to the Pulse <br> output instance register. Allowed values are 1-4. |
| 2 | Write the value 1 to the Turn off pulse output register. |

$\qquad$
Follow the steps in the table below to read the current pulse output configuration:

| Step | Action |
| :--- | :--- |
| 1 | Choose the pulse output instance to read configuration for by writing a number <br> to the Pulse output instance register. Allowed values are 1-4. |
| 2 | Read the Port number register to get the I/O port number used by the chosen <br> pulse output instance. |
| 3 | Read the Energy quantity registers to get the OBIS code of the quantity used <br> for the chosen pulse output instance. |
| 4 | Read the Pulse frequency active or reactive energy registers, depending on the <br> chosen energy type, to get the pulse frequency used by the chosen pulse out- <br> put instance. |
| 5 | Read the Pulse length registers to get the pulse length used by the chosen <br> pulse output instance. |
| 6 | Repeat steps 1 to 5 for all pulse outputs. |

### 9.9.6 Tariffs

## General

Tariff configuration defines the currently used tariff source, i.e. communication, clock or inputs. It is also defines the settings that are specific for each of these sources.

The following table shows an overview of the mapping table:

| Quantity | Details | Start Reg (Hex) | Size |
| :--- | :--- | :--- | :--- |
| Tariffs | Tariff source | 8 C 90 | 1 |
| Tariffs | Input configuration | 8 C 91 | 1 |
| Tariffs | Season configuration | 8 C 92 | 35 |

Tariff source register

Input<br>configuration register

| Quantity | Details | Start Reg (Hex) | Size |
| :--- | :--- | :--- | :--- |
| Tariffs | Week profile configuration | 8CB5 | 24 |
| Tariffs | Day profile configuration | 8CCD | 6 |
| Tariffs | Special days configuration | 8CD3 | 5 |

The Tariff source register is used to read or write the source used for controlling the tariffs. Possible values are listed in the table below:

| Value | Description |
| :--- | :--- |
| 0 | Clock (Calendar) |
| 1 | Communication |
| 2 | Inputs |

The Input configuration register is used for reading and writing tariff input configuration. It decides how many tariffs are used, and which tariff is activated for every combination of values on the inputs. The following table describes the contents of the Input configuration register:

| Byte | Bits | Description | Possible values |
| :--- | :--- | :--- | :--- |
| 0 (high byte) | Entire <br> byte | The number of tariffs to use | $1-4$ |
|  | $0-1^{*}$ | Tariff to activate when both in- <br> puts are OFF | $0-3(0=$ tariff 1, etc $)$ |
|  | $2-3^{*}$ | Tariff to activate when input 3 is <br> ON and input 4 is OFF | $0-3$ |
|  | $4-5^{*}$ | Tariff to activate when input 3 is <br> OFF and input 4 is ON | $0-3$ |
|  | $6-7^{*}$ | Tariff to activate when both in- <br> puts are ON | $0-3$ |

* Bit 0 is the least significant bit.

The following table describes the group of registers for configuring seasons:

| Function | Start <br> Reg <br> (Hex) | Size | Description | Read/ <br> write |
| :--- | :--- | :--- | :--- | :--- |
| Number of sea- <br> sons | 8 C 92 | 1 | The number of seasons used (1-4) | RW |
| Season number | 8 C 93 | 1 | Current season number during read or <br> write of configuration | R |

| Function | Start <br> Reg <br> (Hex) | Size | Description | Read/ <br> write |
| :--- | :--- | :--- | :--- | :--- |
| Season | $8 C 94$ | 33 | Name, start date/time and associated <br> week profile for the season | R/W |

## Season registers

The following table describes the group of registers for configuring a season:

| Function | Start <br> Reg <br> (Hex) | Size | Description | Read/ <br> write |
| :--- | :--- | :--- | :--- | :--- |
| Season name | 8 C94 | 15 | The season name. Expressed as an <br> ASCII character string, with a maximum <br> length of 30 characters. First character is <br> in the high byte of the lowest register. <br> Any unused space in the end must be <br> set to binary 0. | R/W |
| Season start | 8 C 93 | 3 | Start date/time of the season. Formatted <br> as Date/Time. See "Date and time for- <br> mat" on page - 112. Hour, Minute and <br> Second are currently not used and must <br> be set to FF. | R/W |
| Week profile | $8 C 94$ | 15 | The name of the week profile associated <br> with this season. Same format as Sea- <br> son name. | R/W |

Note - All 33 registers in the table above must be written in one operation, otherwise the values will not take effect.

## Write season

 configurationFollow the steps in the table below to write the season configuration:

| Step | Action |
| :--- | :--- |
| 1 | Write the number of seasons to use to the Number of seasons register. This is <br> a value between 1 and 4. |
| 2 | Write the desired season configuration of the first season to the Season regis- <br> ters. |
| 3 | Repeat step 2 for all seasons that shall be used, ie. the same number of times <br> as the value written in step 1. |

Follow the steps in the table below to read the current season configuration:

| Step | Action |
| :--- | :--- |
| 1 | Read the Number of seasons register to find out how many seasons are used. |
| 2 | Read from the Season registers to get the season name, start date/time and <br> week profile associated with the first season. |

| Step | Action |
| :--- | :--- |
| 3 | Repeat step 2 for each season, until all season configurations have been read. <br> This means step 2 shall be performed the same number of times as the value <br> read in step 1. |

Note - Step 1 initiates the readout procedure and can NOT be left out, even if the number of seasons used is already known.

Note - The Season number register can optionally be read together with the Season registers in step 2. The Season number register holds the current season number, starting from 1 after reading the Number of seasons register. It is incremented every time the Season registers are read.

Week profile configuration registers

The following table describes the group of registers for configuring week profiles:

| Function | Start <br> Reg <br> (Hex) | Size | Description | Read/ <br> write |
| :--- | :--- | :--- | :--- | :--- |
| Number of week <br> profiles | 8CB5 | 1 | The number of week profiles used (1-4) | R/W |
| Week profile <br> number | 8 CB6 | 1 | Current week profile number during read <br> or write of configuration | R |
| Week profile | 8 CB | 22 | Name and day IDs for the week profile | RN |

The following table describes the group of registers for configuring a week profile:

| Function | Start <br> Reg <br> (Hex) | Size | Description | Read/ <br> write |
| :--- | :--- | :--- | :--- | :--- |
| Week profile <br> name | 8CB7 | 15 | The week profile name. Same format as <br> described in Season registers above. | R/W |
| Day ID monday | 8 CC | 1 | Day ID for monday. Allowed values are <br> $1-16$. | R/W |
| Day ID ... | $\ldots$ | 1 | $\ldots$ | RN |
| Day ID sunday | 8 BC | 1 | Day ID for sunday. Allowed values are 1- <br> 16. | R/W |

Note - All 22 registers in the table above must be written in one operation, otherwise the values will not take effect.

Note - If the tariff configuration has been performed using any other communication protocol, other values than 1-16 can occur for Day IDs. When configuring over Modbus though, the values written have to be within this range.

Write week profile configuration

Follow the steps in the table below to configure the week profiles:

| Step | Action |
| :--- | :--- |
| 1 | Write the number of week profiles to use to the Number of week profiles regis- <br> ter. This is a value between 1 and 4. |
| 2 | Write the desired week profile configuration of the first week profile to the Week <br> profile registers. |
| 3 | Repeat step 2 for all week profiles that shall be used, i.e. the same number of <br> times as the value written in step 1. |

Read week profile configuration

Follow the steps in the table below to read the current week profile configuration:

| Step | Action |
| :--- | :--- |
| 1 | Read the Number of week profiles register to find out how many week profiles <br> are used. |
| 2 | Read from the Week profile registers to get the week profile name and day ID:s <br> for the first week profile. |
| 3 | Repeat step 2 for each week profile, until all week profile configurations have <br> been read. This means step 2 shall be performed the same number of times as <br> the value read in step 1. |

Note - Step 1 initiates the readout procedure and can NOT be left out, even if the number of week profiles used is already known.

Note - The Week profile number register can optionally be read together with the Week profile registers in step 2. The Week profile number register holds the current week profile number, starting from 1 after reading the Number of week profiles register. It is incremented every time the Week profile registers are read.

## Day profile

 configuration registersThe following table describes the group of registers for configuring day profiles:

| Function | Start <br> Reg <br> (Hex) | Size | Description | Read/ <br> write |
| :--- | :--- | :--- | :--- | :--- |
| Number of day <br> profiles | BCD | 1 | The number of day profiles used (1-16) | RN |
| Day profile num- <br> ber | 8 CCE | 1 | Current day profile number during read <br> or write of configuration | $R$ |
| Number of ac- <br> ions | 8 CCF | 1 | The number of actions during a day pro- <br> file (1-30) | R/W |
| Action number | 8 CDC | 1 | Current action number during read or <br> write of configuration | R |
| Action | $8 C D 1$ | 2 | Time when the action shall be per- <br> formed, and what to do | R/W |

## Action registers

The following table describes the group of registers for configuring a day profile action:

| Function | Byte number | Description |
| :--- | :--- | :--- |
| Execution time | 0 (High byte) | Hour when the action shall be performed. |
|  | 1 (Low byte) | Minute when the action shall be performed. |
| Action id | (Both bytes) | Decides the action to perform. See the list of <br> possible actions below. |

Note - Both registers in the table above must be written in one operation, otherwise the values will not take effect.

Possible actions to perform are activating tariffs and setting or resetting outputs. The possible values for action id are listed in the table below:

| Value | Description |
| :--- | :--- |
| 0 | Activate tariff 1 |
| $\ldots$ | $\ldots$ |
| 3 | Activate tariff 4 |
| 100 | Set output 1 |
| 101 | Reset output 1 |
| $\ldots$ | $\ldots$ |
| 106 | Set output 4 |
| 107 | Reset output 4 |

Write day profile configuration

Follow the steps in the table below to configure the day profiles:

| Step | Action |
| :--- | :--- |
| 1 | Write the number of day profiles to use to the Number of day profiles register. <br> This is a value between 1 and 16. |
| 2 | Write the number of actions to perform for the first day profile to the Number of <br> actions register. This is a number between 1 and 30. |
| 3 | Write the execution time and action id for the first action to perform during the <br> day to the Action registers. |
| 4 | Repeat step 3 for all actions that shall be performed during the day, i.e. the <br> same number of times as the value written in step 2. |
| 5 | Repeat step 2-4 for all day profiles, i.e. the same number of times as the value <br> written in step 1. |

## Read day profile

 configurationFollow the steps in the table below to read the current day profile configuration:

| Step | Action |
| :--- | :--- |
| 1 | Read the Number of day profiles register to find out how many day profiles are <br> used. |
| 2 | Read the Number of actions register to find out how many actions are config- <br> red for the first day profile. |
| 3 | Read from the Action registers to get the execution time and action id for the <br> first action. |
| 4 | Repeat step 3 for all actions that are configured for the day, i.e. the same num- <br> ber of times as the value read in step 2. |
| 5 | Repeat step 2-4 for all day profiles, i.e. the same number of times as the value <br> read in step 1. |

Note - Step 1 and 2 initiate the readout procedure and can NOT be left out, even if the number of day profiles and actions used are already known.

## Special days

configuration registers

Note - The Day profile number register can optionally be read together with the Number of actions register in step 2. The Day profile number register holds the current day profile number, starting from 1 after reading the Number of day profiles register. It is incremented every time the last action during the day is read from Action registers.
In the same way the Action number register can optionally be read together with the Action registers in step 3. The Action number register holds the current action number, starting from 1 after reading the Number of actions register. It is incremented every time the Action registers are read.

The following table describes the group of registers for configuring special days:

| Function | Start <br> Reg <br> (Hex) | Size | Description | Read/ <br> write |
| :--- | :--- | :--- | :--- | :--- |
| Number of spe- <br> cial days | 8CD3 | 1 | The number of special days used (1-50) | RN |
| Special day num- <br> ber | 8 CD | 1 | Current special day number during read <br> or write of configuration | R |
| Special day | 8CD5 | 3 | Date and associated day ID for the spe- <br> cial day | R/W |

Special day
The following table describes the group of registers for configuring a week
registers
file:

| Contents | Register | Byte nr | Description |
| :--- | :--- | :--- | :--- |
| Date | 8 CD 3 | 0 (high byte) | Year |

| Contents | Register | Byte nr | Description |
| :--- | :--- | :--- | :--- |
|  |  | 1 | Month |
|  | 8CD4 | 0 | Day |
|  |  | 1 | Not used |
| Day id | 8 CD | (Both) | Day ID associated with the special day |

Note - All 3 registers in the table above must be written in one operation, otherwise the values will not take effect.

Write special day Follow the steps in the table below to configure the special days:

## configuration

| Step | Action |
| :--- | :--- |
| 1 | Write the number of special days to use to the Number of special days register. <br> This is a value between 1 and 50. |
| 2 | Write the desired date and day id of the first special to the Special day registers. |
| 3 | Repeat step 2 for all special days that shall be used, i.e. the same number of <br> times as the value written in step 1. |

Read special day configuration

Follow the steps in the table below to read the current special day configuration:

| Step | Action |
| :--- | :--- |
| 1 | Read the Number of special days register to find out how many special days <br> are used. |
| 2 | Read from the Special day registers to get the date and day id for the first spe- <br> cial day. |
| 3 | Repeat step 2 for each special day, until all special day configurations have <br> been read. This means step 2 shall be performed the same number of times as <br> the value read in step 1. |

Note - Step 1 initiates the readout procedure and can NOT be left out, even if the number of special days used is already known.

Note - The Special day number register can optionally be read together with the Special day registers in step 2. The Special day number register holds the current special day number, starting from 1 after reading the Number of special days register. It is incremented every time the Special day registers are read.

## Chapter 10:Communication with M-Bus

## Overview <br> This chapter describes how to read meter data and to send commands to the meter over M-Bus.

In this chapter
The following topics are covered in this chapter:
10.1 Protocol Description

154
10.2 Standard Readout of Meter Data ..................................................... 172
10.3 Special Readout of Meter Data ..................................................... 204
10.4 Sending Data to the Meter ............................................................ 235

### 10.1 Protocol Description

## General

The communication protocol described in this chapter meets the requirements of EN 13757-2 and EN 13757-3.

The communication can be divided in two parts. One part is reading data from the meter and the other part is sending data to it.
The data readout procedure starts when the master sends a REQ_UD2 telegram to the meter. The meter responds with a RSP_UD telegram. A typical readout is a multi-telegram readout.
Some data in the meter can only be read by first sending a SND_UD followed by REQ_UD2. This is true for load profiles, demand and log files.
Using SND_UD telegrams data can be sent to the meter.

## Communication objects

The following quantities can be read by sending a REQ_UD2 to the meter

| Register | Communication objects |
| :---: | :---: |
| Active import energy, total | Total cumulative active imported energy |
| Active import energy, tariff 1 | Cumulative active imported energy tariff 1 |
| Active import energy, tariff 2 | Cumulative active imported energy tariff 2 |
| Active import energy, tariff 3 | Cumulative active imported energy tariff 3 |
| Active import energy, tariff 4 | Cumulative active imported energy tariff 4 |
| Reactive import energy, total | Total cumulative reactive imported energy |
| Reactive import energy, tariff 1 | Cumulative reactive imported energy tariff 1 |
| Reactive import energy, tariff 2 | Cumulative reactive imported energy tariff 2 |
| Reactive import energy, tariff 3 | Cumulative reactive imported energy tariff 3 |
| Reactive import energy, tariff 4 | Cumulative reactive imported energy tariff 4 |
| Active export energy, total | Total cumulative active exported energy |
| Active export energy, tariff 1 | Cumulative active exported energy tariff 1 |
| Active export energy, tariff 2 | Cumulative active exported energy tariff 2 |
| Active export energy, tariff 3 | Cumulative active exported energy tariff 3 |
| Active export energy, tariff 4 | Cumulative active exported energy tariff 4 |
| Reactive export energy, total | Total cumulative reactive exported energy |
| Reactive export energy, tariff 1 | Cumulative reactive exported energy tariff 1 |
| Reactive export energy, tariff 2 | Cumulative reactive exported energy tariff 2 |
| Reactive export energy, tariff 3 | Cumulative reactive exported energy tariff 3 |
| Reactive export energy, tariff 4 | Cumulative reactive exported energy tariff 4 |
| CT Ratio | Current transformer ratio (numerator) |
| CT Ratio | Current transformer ratio (denominator) |
| VT Ratio | Voltage transformer ratio (numerator) |
| VT Ratio | Voltage transformer ratio (denominator) |
| Outputs | Read and set status of outputs |
| Inputs, current state | Read current state of input 1,2, 3 and 4 |

| Register | Communication objects |
| :---: | :---: |
| Inputs, stored state | Read and reset stored state of input 1,2, 3 and 4 |
| Inputs, counter | Read and clear input pulse counter 1,2,3 and 4 |
| Current, L1 | Instantaneous current in the L1 phase |
| Current, L2 | Instantaneous current in the L2 phase |
| Current, L3 | Instantaneous current in the L3 phase |
| Voltage, L1-N | Instantaneous voltage between L1 and neutral |
| Voltage, L2-N | Instantaneous voltage between L2 and neutral |
| Voltage, L3-N | Instantaneous voltage between L3 and neutral |
| Voltage, L1-L2 | Instantaneous voltage between L1 and L2 |
| Voltage, L2-L3 | Instantaneous voltage between L2 and L3 |
| Voltage, L1-L3 | Instantaneous voltage between L1 and L3 |
| Active Power, Total | Instantaneous total active power |
| Active Power, L1 | Instantaneous active power in L1 |
| Active Power, L2 | Instantaneous active power in L2 |
| Active Power, L3 | Instantaneous active power in L3 |
| Reactive Power, Total | Instantaneous total reactive power |
| Reactive Power, L1 | Instantaneous reactive power in L1 |
| Reactive Power, L2 | Instantaneous reactive power in L2 |
| Reactive Power, L3 | Instantaneous reactive power in L3 |
| Apparent Power, Total | Instantaneous total apparent power |
| Apparent Power, L1 | Instantaneous apparent power in L1 |
| Apparent Power, L2 | Instantaneous apparent power in L2 |
| Apparent Power, L3 | Instantaneous apparent power in L3 |
| Voltage phase angle, L1 | Instantaneous voltage phase angle for L1 (L1 voltage is reference) |
| Voltage phase angle, L2 | Instantaneous voltage phase angle for L2 (L1 voltage is reference) |
| Voltage phase angle, L3 | Instantaneous voltage phase angle for L3 (L1 voltage is reference) |
| Current phase angle, L1 | Instantaneous current phase angle for L1 (L1 voltage is reference) |
| Current phase angle, L2 | Instantaneous current phase angle for L2 (L1 voltage is reference) |
| Current phase angle, L3 | Instantaneous current phase angle for L3 (L1 voltage is reference) |
| Phase angle power, Total | Instantaneous phase angle for total power |
| Phase angle power L1 | Instantaneous phase angle power for L1 |
| Phase angle power L2 | Instantaneous phase angle power for L2 |
| Phase angle power L3 | Instantaneous phase angle power for L3 |
| Installation check | Read result of and clear installation check |
| Current quadrant, Total | Quadrant in which the meter is measuring |
| Current quadrant, L1 | Quadrant in which the meter is measuring, L1 |
| Current quadrant, L2 | Quadrant in which the meter is measuring, L2 |

| Register | Communication objects |
| :---: | :---: |
| Current quadrant, L3 | Quadrant in which the meter is measuring, L3 |
| Power fail counter | Read and reset power fail counter |
| Total power outage time | Read and reset total power outage time |
| Current tariff | Read and set current tariff |
| Manufacturer | Manufacturer information |
| FW-version | Firmware version |
| Warning flags | Read warning flags |
| Info flags | Read info flags |
| Alarm flags | Read alarm flags |
| Error flags | Read error flags |
| Date and time | Read and set date and time |
| Previous values | Read previous values |
| Load profile | Read load profile data |
| Demand | Read Demand (max. and min. data) |
| Event log | Read event log data |
| System log | Read system log data |
| Audit log | Read audit log data |
| Net quality log | Read net quality log data |
| Settings log | Read transformer log data |
| Current harmonics | Read THD and harmonics on each current measured |
| Voltage harmonics | Read THD and harmonics on each voltage measured |
| Apparent import energy, total | Total cumulative apparent imported energy |
| Apparent export energy, total | Total cumulative apparent exported energy |
| Active import energy, L1 | Cumulative active imported energy in the L1 phase |
| Active import energy, L2 | Cumulative active imported energy in the L2 phase |
| Active import energy, L3 | Cumulative active imported energy in the L3 phase |
| Active export energy, L1 | Cumulative active exported energy in the L1 phase |
| Active export energy, L2 | Cumulative active exported energy in the L2 phase |
| Active export energy, L3 | Cumulative active exported energy in the L3 phase |
| Reactive import energy, L1 | Cumulative reactive imported energy in the L1 phase |
| Reactive import energy, L2 | Cumulative reactive imported energy in the L2 phase |
| Reactive import energy, L3 | Cumulative reactive imported energy in the L3 phase |
| Reactive export energy, L1 | Cumulative reactive exported energy in the L1 phase |
| Reactive export energy, L2 | Cumulative reactive exported energy in the L2 phase |
| Reactive export energy, L3 | Cumulative reactive exported energy in the L3 phase |

| Register | Communication objects |
| :--- | :--- |
| Apparent import energy, L1 | Cumulative apparent imported energy in the L1 <br> phase |
| Apparent import energy, L2 | Cumulative apparent imported energy in the L2 <br> phase |
| Apparent import energy, L3 | Cumulative apparent imported energy in the L3 <br> phase |
| Apparent export energy, L1 | Cumulative apparent exported energy in the L1 <br> phase |
| Apparent export energy, L2 | Cumulative apparent exported energy in the L2 <br> phase |
| Apparent export energy, L3 | Cumulative apparent exported energy in the L3 <br> phase |

## Read/write commands

The following tasks are possible to perform with SND_UD telegrams:

| Command |
| :--- |
| Set tariff |
| Set primary address |
| Change baud rate |
| Reset power fail counter |
| Reset power outage time |
| Set CT Ratio numerator |
| Set CT Ratio denominator |
| Set VT Ratio numerator |
| Set VT Ratio denominator |
| Select Status information |
| Reset stored state input |
| Reset input counters |
| Set output |
| Set date time |
| Set date |
| Send Password |
| Freeze Max demand |
| Set communication access level |
| Read Request Load profile |
| Read request previous values |
| Read request demand (maximum and minimum |
| Read request Log (System, Event, quality, audit and Transformer Logs) |
| Read request current harmonics |
| Read request voltage harmonics |
| Read/Write Load profile settings |
| Read/Write Previous value settings |

| Command |
| :--- |
| Read/Write Alarm settings |
| Read/Write Tariff settings |

### 10.1.1 Telegram Format

## General

M-Bus uses 3 different telegram formats. The formats are identified by the start character.

| Single Character | Short Frame | Long Frame |
| :--- | :--- | :--- |
| E5H | Start (10h) | Start (68h) |
|  | C-Field | L-Field |
|  | A-Field | L-Field |
|  | Check Sum | Start (68h) |
|  | Stop (16h) | C-Field |
|  |  | A-Field |
|  |  | CI-Field |
|  |  | User Data (0-252 Bytes) |
|  |  | Check Sum |
|  |  | Stop (16h |

The Single Character format consists of a single character and is used to acknowledge received telegrams.

The Short Frame format is identified by its start character (10h) and consists of five characters. Besides the C - and A-fields it includes the check sum and the stop character 16 h.

The Long Frame format is identified by its start character (68h) and consists of a variable number of characters. After the start character the L-field is transmitted twice, then the start character once again followed by the C-, A- and CI-fields. The user data ( $0-252$ bytes) is transmitted after the CI-field followed by the check sum and the stop character (16h).

### 10.1.1.1 Field description

## General All fields in the telegram have a length of 1 byte ( 8 bits).

The L-Field The L-Field (length field) gives the size of the user data (in bytes) plus 3 (for the C-, A- and CI-Fields). It is transmitted twice in the telegrams using the long frame format.

## The C-Field

The C-Field (control field) contains information about the direction of the data flow and error handling. Besides labeling the functions and the actions caused by them, the control field specifies the direction of data flow and is responsible for various parts of the communication to and from the meter.

The following table shows the coding of the C-Field:

| Bit No. | $\mathbf{7}$ | $\mathbf{6}$ | $\mathbf{5}$ | $\mathbf{4}$ | $\mathbf{3}$ | $\mathbf{2}$ | $\mathbf{1}$ | $\mathbf{0}$ |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| To meter | 0 | PRM | FCB | FCV | F3 | F2 | F1 | F0 |
| From meter | 0 | PRM | 0 | 0 | F3 | F2 | F1 | F0 |

The primary message bit (PRM) is used to specify the direction of the data flow.It is set to 1 when a telegram is sent from a master to the meter and to 0 in the other direction.

The frame count bit valid (FCV) is set to 1 by the master to indicate that the frame count bit (FCB) is used. When the FCV is set to 0 , the meter ignores the FCB.

The FCB is used to indicate successful transmission procedures. A master shall toggle the bit after a successful reception of a reply from the meter. If the expected reply is missing, or the reception of it is faulty, the master resends the same telegram with the same FCB. The meter answers, to a REQ_UD2-request with toggled FCB and a set FCV, with a RSP_UD containing the next telegram of a multitelegram answer. If the FCB is not toggled it will repeat the last telegram. The actual values will be updated in a repeated telegram.

On receipt of a SND_NKE the meter clears the FCB. The meter uses the same FCB for primary addressing, secondary addressing and point-to-point communication.

The bits 0 to 3 (F0, F1, F2 and F3) of the control field are the function code of the message. The following table shows the function codes:

| Comand | C-Field <br> (binary) | C-Field <br> (hex) | Telegram | Description |
| :--- | :--- | :--- | :--- | :--- |
| SND_NKE | 01000000 | 40 | Short frame | Initialization of meter |
| SND_UD | $01 F 10011$ | $53 / 73$ | Long frame | Send user data to meter |
| REQ_UD2 | 01 F1 1011 | $5 b$ | Short frame | Request for class 2 data |
| RSP_UD | 00001000 | 08 | Long frame | Data transfer form meter to <br> master after request. |

A-Field
The A-Field (address field) is used to address the recipient in the calling direction, and to identify the sender of information in the receiving direction. The size of this field is one byte, and can therefore take values from 0 to 255 .

The following table shows the allocation of addresses:

| Address | Description |
| :--- | :--- |
| 0 | Factory default |
| $1-250$ | Can be given to meters as individual primary addresses, either via the <br> bus (secondary addressing) or via the buttons directly on the meter. |
| $251-252$ | Reserved for future use. |
| 253 | Used by the secondary addressing procedure (FDh). |
| 254 | Used for point-to-point communication (FEh). The meter replies with its <br> primary address. |
| 255 | Used for broadcast transmissions to all meters (FFh). None of the meters <br> replies to a broadcast message. |

## Cl-Field

The CI-field (control information) codes the type and sequence of application data to be transmitted in the frame. Bit two (counting begins with bit 0, value 4), called M-bit or Mode bit, in the Cl-field gives information about the used byte sequence in multi-byte data structures. For communication with the meter, the Mode bit shall not be set (Mode 1) meaning the least significant byte of a multibyte record is transmitted first.
The following table shows the codes to be used by the master:

| CI_Field codes | Application |
| :--- | :--- |
| 51 h | Data send |
| 52 h | Selection of slaves |
| B8h | Set baud rate to 300 |
| B9h | Set baud rate to 600 |
| Bah | Set baud rate to 1200 |
| BBh | Set baud rate to 2400 |
| BCh | Set baud rate to 4800 |
| BDh | Set baud rate to 9600 |
| BEh | Set baud rate to 19200 |
| BFh | Set baud rate to 38400 |

The meter uses code 72 in the CI-Field to respond to requests for user data.

User data The User Data contains the data to be sent to the recipient.
The following table shows the structure of the data sent from the meter to the master:

| Fixed data header | Data records | MDH |
| :--- | :--- | :--- |
| 12 bytes | Variable number of bytes | 1 byte |

The following table shows the structure of the data sent from the master to the meter:

| Data records |
| :--- |
| Variable number of bytes |

Fixed data header The following table shows the structure of the fixed data header:

| ID No. | Manufacturer | Version | Medium | Access No. | Status | Signature |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 4 bytes | 2 bytes | 1 byte | 1 byte | 1 byte | 1 byte | 2 byte |

The following list explains the content of the fixed data header:

- Identification No. is the 8 -digit serial number of the meter (BCD coded).
- Manufacturer is set to 0442 h meaning ABB
- Version specifies the version of the protocol implementation. The meters currently use the protocol version equal to $0 \times 20$.
- Medium byte is set to 02 h to indicate electricity.
- Access number is a counter that counts successful accesses.
- Status byte is used to indicate the meter status.

| Bit | Meaning |
| :--- | :--- |
| 0 | Meter busy |
| 1 | Internal error |
| 2 | Power low |
| 3 | Permanent error |
| 4 | Temporary error |
| 5 | Installation error |
| 6 | Not used |
| 7 | Not used |

- Signature is set to 0000 h

## Data records

Data information block (DIB)

The data, together with information regarding coding, length and the type of data is transmitted in data records. The maximum total length of the data records is 240 bytes.

The following table shows the structure of the data record (transmitted left to right):

| Data Record Header |  |  | Data |  |
| :--- | :--- | :--- | :--- | :--- |
| Data Information Block (DIB) | Value Information Block (VIB) |  |  |  |
| DIF | DIFE | VIF | VIFE |  |
| 1 byte | $0-10$ bytes | 1 byte | $0-10$ bytes | 0 -n bytes |

Each Data record consists of a data record header (DRH) and the actual data. The DRH in turn consists of the data information block (DIB) to describe the length, type and coding of the data, and the value information block (VIB) to give the value of the unit and the multiplier.

The DIB contains at least one byte (Data Information Field, DIF), and is in some cases expanded with, a maximum of 10, DIFE's (Data Information Field Extension).

The following table shows the structure of the Data Information Field (DIF):

| Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Extension bit | LSB $^{1}$ of storage No. | Function Field | Data Field |  |  |  |  |

1. Least significant bit.

The following list explains the content of the DIF:

- The Extension Bit is set when the next byte is a DIFE.
- The LSB of storage No. is normally set to 0 to indicate actual value. ( $1=$ stored value).
- The Function Field is set to 00 for instantaneous values, 01 for maximum values and 10 for minimum values.
- The Data Field shows the format of the data. The following table shows the coding of the data field:

| Code | Meaning | Length |
| :--- | :--- | :--- |
| 0000 | No Data | 0 |
| 0001 | 8 Bit Integer | 1 |
| 0010 | 16 Bit Integer | 2 |
| 0100 | 32 Bit Integer | 4 |
| 0111 | 64 Bit Integer | 8 |
| 1010 | 4 digit BCD | 2 |
| 1111 | 6 digit BCD | 3 |
| 1100 | 8 digit BCD | 4 |

| Code | Meaning | Length |
| :--- | :--- | :--- |
| 1101 | Variable Length <br> (ASCII) | Variable |
| 1110 | 12 digit BCD | 6 |

The following table shows the structure of the Data Information Field Extension (DIFE)

| Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Extension bit | Unit | Tariff | Storage No. |  |  |  |  |

The following list explains the content of the DIFE:

- Unit is used for power and energy values show the type of power/energy. It is also used to define the number of inputs/outputs and to specify sign of offset when accessing event log data.
- Tariff is used for energy values to give tariff information.
- Storage number is set to 0 in values read to indicate momentary values. Storage number bigger than 0 is used to indicate previously stored values, i.e, values stored at a specific point of time in the past.

Value Information block (VIB)

## Data <br> The Data follows a VIF or a VIFE without the extension bit set.

## Manufacturer data header (MDH)

The manufacturer data header (MDH) is either made up by the character 1Fh that indicates that more data will follow in the next telegram, or by 0Fh indicating the last telegram.

VIB follows a DIF or DIFE without extension bit. It contains one value information field (VIF) and is in some cases expanded with up to 10 value information field extensions (VIFE).
The following table shows the structure of the value informatiuon field (VIF):

| Bit 7 | 6 | 5 | $\mathbf{4}$ | $\mathbf{3}$ | $\mathbf{2}$ | $\mathbf{1}$ | $\mathbf{0}$ |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Extension Bit | Value Information |  |  |  |  |  |  |

Value information contains information about the value (unit, status, etc.,) The extension bit is set when the next byte is a VIFE.

If VIF or VIFE $=$ FFh the next VIFE is manufacturer specific. The manufacturer specific VIFE has the same construction as a VIF. If the extension bit of the manufacturer specific VIFE is set, and the VIFE is less than 11111000 , the next byte is a standard VIFE, otherwise it is the first data byte. If the extension bit of the manufacturer specific VIFE is set and the VIFE is bigger than or equal to 1111 1000, the next byte is an extension of manufacturer specific VIFE's.

## Check sum

The Check Sum is used to recognize transmission and synchronization faults. It is calculated from the arithmetical sum, of the bytes from the control field to the last user data, without taking carry digits into account .

### 10.1.2 Value Information Field codes

### 10.1.2.1 Standard VIF codes

| VIF-code | Description | Range coding | Range |
| :--- | :--- | :--- | :--- |
| E000 Onnn | Energy | $10\left(\left(^{n n-3}\right) \quad\right.$ Wh | 0.001 Wh to 10000 Wh |
| E010 1nnn | Power | $10\left({ }^{\text {nn-3 }}\right) \quad \mathrm{W}$ | 0.001 W to 10000 W |
| E010 00nn | Duration | $\mathrm{nn}=00$ seconds <br> $\mathrm{nn}=01$ minutes <br> $\mathrm{nn}=10$ hours <br> $\mathrm{nn}=11$ days |  |
| E110 110n | Time point | $\mathrm{n}=0:$ date <br> $\mathrm{n}=1:$ time \& date | Data type G <br> Data type F or 6 byte <br> BCD coding |
| E111 1000 | Fabrication No. | Bus address | 00000000 to <br> 99999999 |
| E111 1010 | Extension of VIF- <br> codes | Extension of VIF- <br> codes |  |
| 11111011 | Manufacturer <br> specific |  | True VIF is given in <br> the first VIFE and is <br> coded using Table FD |
| 11111101 | Next VIFE is manufac- <br> turer specific |  |  |
| 11111111 |  |  |  |

10.1.2.2 Standard codes for VIFE used with extension indicator FDh

If the VIF contains the extension indicator FDh the true VIF is contained in the first VIFE.

| VIFE-code | Description |
| :--- | :--- |
| E000 1010 | Manufacturer |
| E000 1100 | Version |
| E000 1110 | Firmware Version |
| E001 1010 | Digital Output (binary) |
| E001 1011 | Digital Input (binary) |
| E001 1100 | Baud rate |
| E010 01nn | Interval length, 00: seconds, 01: minutes), 10: hours, 11: <br> days |

| VIFE-code | Description |
| :--- | :--- |
| E100 nnnn | $10\left({ }^{\text {(nnn-9 }) ~ V o l t s ~}\right.$ |
| E101 nnnn | $10\left({ }^{\text {(nnn-12 })}\right.$ A |
| E110 0001 | Cumulating counter |
| E001 0110 | Password |

### 10.1.2.3 Standard codes for VIFE

The following values for VIFE's are defined for an enhancement of VIF's other than FDh and FBh:

| VIFE-code | Description |
| :--- | :--- |
| E010 0111 | Per measurement (interval) ${ }^{12}$ |
| E011 1001 | Start date(/time) of |
| E110 1f1b | Date (/time) of, $b=0:$ end of, $b=1$ : begin of, $f$ is not used <br> in meters, always $0^{12}$ |
| 11111111 | Next VIFE is manufacturer specific |

1. Date (/time) of "or duration of" relates to the information which the whole data record contains.
2. The information about usage of data type $F$ (date and time) or data type $G$ (date) can be derived from the data field ( 0010 b: type G/0100: type F).

### 10.1.2.4 First manufacturer specific VIFE-codes

| VIFE-code | Description |
| :--- | :--- |
| E000 0000 | Total |
| E000 0001 | L1 |
| E000 0010 | L2 |
| E000 0011 | L3 |
| E000 0100 | N |
| E000 0101 | L1-L2 |
| E000 0110 | L3-L2 |
| E000 0111 | L1 - L3 |
| E001 0000 | Pulse frequency |
| E001 0011 | Tariff |
| E001 0100 | Installation check |
| E001 0101 | Status of values |
| E001 0111 | Current quadrant |
| E001 1000 | Power fail counter |

| VIFE-code | Description |
| :---: | :---: |
| E010 0000 | Current Transformer ratio numerator (CT ratio) |
| E010 0001 | Voltage Transformer ratio numerator (VT ratio) |
| E010 0010 | Current Transformer ratio denominator (CT ratio) |
| E010 0011 | Voltage Transformer ratio denominator (VT ratio) |
| E010 0100 | CO2 conversion factor ( kg * $10^{-3} / \mathrm{kWh}$ ) |
| E010 0101 | Currency conversion factor (curr * $10^{-3} / \mathrm{kWh}$ ) |
| E010 0110 | Error flags |
| E010 0111 | Warning flags |
| E010 1000 | Information flags |
| E010 1001 | Alarm flags |
| E100 Onnn | Phase angle voltage (degrees *10 ${ }^{(n n n-3)}$ ) |
| E100 1nnn | Phase angle current (degrees *10 ${ }^{(n n n-3)}$ ) |
| E101 Onnn | Phase angle power (degrees *10 ${ }^{(n n n-3)}$ ) |
| E101 1nnn | Frequency ( Hz *10 ${ }^{\left({ }^{(n n-3)}\right)}$ |
| E110 Onnn | Power factor (*10 (nnn-3) |
| E110 1010 | Change communication write access level |
| E110 1100 | Power outage time |
| E110 1101 | Current harmonics |
| E110 1110 | Voltage harmonics |
| E110 1111 | Event type |
| E111 0000 | Measurement period |
| E111 0001 | Reset counter for energy |
| E111 0010 | Resettable register |
| E111 0110 | Sequence number (audit log) |
| E111 1000 | Extension of manufacturer specific VIFE's, next VIFE(s) used for numbering |
| E111 1001 | Extension of manufacturer specific VIFE's, next VIFE(s) specifies actual meaning |
| E111 1110 | Extension of manufacturer specific VIFE's, next VIFE(s) used for manufacturer specific record errors/status |

### 10.1.2.5 VIFE-Codes for reports of record errors (meter to master)

| VIFE-code | Type of record error | Error group |
| :--- | :--- | :--- |
| E000 0000 | None |  |

| VIFE-code | Type of record error | Error group |
| :--- | :--- | :--- |
| E001 0101 | No data available (undefined value) |  |
| E001 1000 | Data error | Data errors |

### 10.1.2.6 VIFE-Codes for object actions (master to meter)

| VIFE-code | Action | Description |
| :--- | :--- | :--- |
| E000 0111 | Clear | Set data to zero |
| E000 1011 | Freeze data | Freeze data to storage <br> number |

10.1.2.7 2:nd manufacturer specific VIFE followed after VIFE 11111000 (F8 hex):

| VIFE-code | Description |
| :--- | :--- |
| Ennn nnnn | Used for numbering (0-127) |

10.1.2.8 2:nd manufacturer specific VIFE followed after VIFE 11111001 (F9 hex):

| VIFE-code | Description |
| :--- | :--- |
| E000 0001 | DST, day of week, day type, season |
| E000 0010 | Quantity specification of maximum demand |
| E000 0011 | Quantity specification of previous values |
| E000 0100 | Quantity specification of load profile |
| E000 0110 | Quantity specification of event log |
| E000 0110 | Tariff source |
| E001 0000 | Readout request of active imported energy load profile in <br> format energy register values at end of intervals |
| E001 0001 | Readout request of active imported energy load profile in <br> format energy consumption per interval |
| E001 0010 | Readout request of reactive imported energy load profile <br> in format energy register values at end of intervals |
| E001 0011 | Readout request of reactive imported energy load profile <br> in format energy consumption per interval |
| E001 0100 | Readout request of input 1 counter load profile in format <br> counter register values at end of intervals |
| E001 0101 | Readout request of input 1 counter load profile in format <br> number of counts per interval |
| E001 0110 | Readout request of input 2 counter load profile in format <br> counter register values at end of intervals |
| E001 0111 | Readout request of input 2 counter load profile in format <br> number of counts per interval |

| VIFE-code | Description |
| :---: | :---: |
| E001 1000 | Readout request of maximum demand |
| E001 1001 | Readout request of previous values |
| E001 1010 | Readout request of event log |
| E001 1011 | Readout request of current harmonics |
| E001 1100 | Readout request of active exported energy load profile in format energy register values at end of intervals |
| E001 1101 | Readout request of active exported energy load profile in format energy consumption per interval |
| E001 1110 | Readout request of reactive exported energy load profile in format energy register values at end of intervals |
| E001 1111 | Readout request of reactive exported energy load profile in format energy consumption per interval |
| E010 0000 | Readout request of apparent imported energy load profile in format energy register values at end of intervals |
| E010 0001 | Readout request of apparent imported energy load profile in format energy consumption per interval |
| E010 0010 | Readout request of apparent exported energy load profile in format energy register values at end of intervals |
| E010 0011 | Readout request of apparent exported energy load profile in format energy consumption per interval |
| E010 0100 | Readout request of input 3 counter load profile in format counter register values at end of intervals |
| E010 0101 | Readout request of input 3 counter load profile in format number of counts per interval |
| E010 0110 | Readout request of input 4 counter load profile in format counter register values at end of intervals |
| E010 0111 | Readout request of input 4 counter load profile in format number of counts per interval |
| E010 1000 | Readout request of current load profile |
| E010 1001 | Readout request of voltage load profile |
| E010 1010 | Readout request of THD voltage load profile |
| E010 1011 | Readout request of THD current load profile |
| E010 1100 | Readout request of power factor load profile |
| E010 1101 | Readout request of voltage harmonics |
| E010 1110 | System log |
| E010 1111 | Audit log |
| E011 0000 | Net quality log |

| VIFE-code | Description |
| :--- | :--- |
| E011 0001 | Settings log |
| E011 0010 | Event log |
| E011 0011 | Event type system log |
| E011 0100 | Event type audit log |
| E011 0101 | Event type net quality log |
| E011 0110 | Event type settings log |
| E011 0111 | Event type event log |
| E011 Onnn | Energy in CO ${ }_{2}(\mathrm{~kg}$ *10nnn-7 $)$ |
| E011 1nnn | Energy in currency (currency * 10 ${ }^{\mathrm{nnn}-3}$ ) |

10.1.2.9 2:nd manufacturer specific VIFE followed after VIFE 11111110 (FE hex):

| VIFE-code | Description |
| :--- | :--- |
| E000 opsI | Data status for load profile, o = overflow, $\mathrm{p}=$ power outage during <br> interval, $\mathrm{s}=$ short interval, $\mathrm{I}=$ long interval |

### 10.1.3 Communication process

## General

The Data Link Layer uses two kinds of transmission services:

| Send/Confirm | SND/CON |
| :--- | :--- |
| Request/Respond | REQ/RSP |

When the meter has received a correct telegram it waits between 35 and 80 ms before it reponds. A telegram is considered as correct if it passes the following tests:

- Start /Parity /Stop bits per character
- Start /Check Sum /Stop characters per telegram format
- In case of a long frame, the number of additional characters received match the L-field (= L Field +6 ).
- If the received data is reasonable

The time between a response from the meter and a new message from the master must be at least 20 ms .

## Send/confirm procedure

## Request/respond procedure

SND_NKE is used to initiate communication with the meter. When the meter has received an NKE followed by a REQ_UD2(see description below), the 1st telegram from the meter is sent out.

If the meter was selected for secondary addressing it will de deselected. The value of the FCB is cleared in the meter, i.e., the meter expects that the first telegram from a master with $\mathrm{FCV}=1$ contains an $\mathrm{FCB}=1$.

The meter can either confirm a correct reception with the single character acknowledge E5h), or it can omit confirmation because it did not receive the telegram correctly.
SND_UD is used to send data to the meter. The meter either confirms reception of a correct message or it omits confirmation because it did not receive the telegram correctly.

REQ_UD2 is used by the master to request data from the meter. RSP_UD is used by the meter to transfer data to the master. The meter indicates to the master that more data will follow in the next telegram by sending 1 Fh as the last user data.

If the meter does not respond to the REQ_UD2, it's an indication that the message was not received correctly or that the address does not match.

### 10.1.3.1 Selection and secondary addressing

General It is possible to communicate with the meter using secondary addressing. The secondary addressing takes place with the help of a selection:

| 68 h | OBh | OBh | 68 h | 53 h | FDh | 52 h | ID <br> $1-4$ | Manu- <br> facturer <br> $1-2$ | Gener- <br> ation | Me- <br> dium | CS | 16h |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |

1. Generation means the same thing as version.

The master sends a SND_UD with the control information 52 h to the address 253 (FDh) and fills the specific meter secondary address fields(identification number, manufacturer, version and medium) with the values of the meter that is to be addressed. The address (FDh) and the control information (52h) is the indication for the meter to compare the following secondary address with its own, and to change into the selected state should it match. In this case the meter answers the selection with an acknowledgement (E5h), otherwise it does not reply. Selected state means that the meter can be addressed with the bus address 253 (FDh).

## Wild cards

During selection individual positions of the secondary addresses can be occupied by wildcards. Such a wildcard means that this position will not be taken into account during selection. In the identification number each individual digit can be wild-carded by a wildcard nibble Fh while the fields for manufacturer, version and medium can be wild-carded by a wildcard byte FFh. The meter will remain
selected until it receives a selection command with non-matching secondary addresses, a selection command with $\mathrm{CI}=56 \mathrm{~h}$, or a SND_NKE to address 253.

### 10.2 Standard Readout of Meter Data

## General

This section describes the readout of the default telegrams containing energy and instrumentation values etc. The data readout procedure starts when the master sends a REQ_UD2 telegram to the meter. The meter responds with a RSP_UD telegram. A typical readout is a multi-telegram readout. The last DIF in the user data part of the telegram is 1 F to indicate that there is more data in the next delegram, or 0 F if there are no more telegrams.

For EQ meters there are up to 7 default telegrams to read. In meters with internal clock more telegrams may follow, containing previous values data. The most recent values are sent out first having storage number 1 , then the second most recently stored values with storage number 2 and so on until all stored previous values have been read. If no previous values exist in a meter with internal clock a telegram is sent out where all data is marked with status byte for "No data available".

It is also possible to read previous values starting from a specific date and backwards in time by sending a special read request.

Note - Note: Normally the meter is configured to send out power values as 32 bit integers, expressed in W (or var/VA) with 2 decimals. This means that the maximum power possible to express is approximately $\pm 21 \mathrm{MW}$

Below following sections is an example of a readout of the 7 default telegrams and 2 previous values telegrams, containing the most recent snapshot of previous values. Note that these are examples only, data types and scaling of the quantities can differ between meters, as well as the allocation of quantities to different telegrams.

### 10.2.1 Example of the 1 st telegram (all values are hexadecimal)

| Byte No. | Size | Value | Description |
| :--- | :--- | :--- | :--- |
| 1 | 1 | 68 | Start character |
| 2 | 1 | FA | L-field, calculated from C field to last user data |
| 3 | 1 | FA | L-field, repeated |
| 4 | 1 | 68 | Start character |
| 5 | 1 | 08 | C-field, RSP_UD |
| 6 | 1 | $x x$ | A-field, address |
| 7 | 1 | 72 | Cl-field, variable data respond, LSB first |
| $8-11$ | 4 | xxxxxxxx | Identification Number, 8 BCD digits |
| $12-13$ | 2 | 4204 | Manufacturer: ABB |
| 14 | 1 | 02 | Version |
| 15 | 1 | 02 | Medium, 02 = Electricity |
| 16 | 1 | xx | Number of accesses |
| 17 | 1 | $x x$ | Status |
| $18-19$ | 2 | 0000 | Signature (0000 = no encryption) |

| Byte No. | Size | Value | Description |
| :---: | :---: | :---: | :---: |
| 20 | 1 | 0E | DIF size, 12 digit BCD |
| 21 | 1 | 84 | VIF for units kWh with resolution 0,01kWh |
| 22 | 1 | xx | VIFE status |
| 23-28 | 6 | xxxxxxxxxxxx | Active imported energy, Total |
| 29 | 1 | 8E | DIF size, 12 digit BCD |
| 30 | 1 | 10 | DIFE, tariff 1 |
| 31 | 1 | 84 | VIF for units kWh with resolution 0,01kWh |
| 32 | 1 | xx | VIFE status |
| 33-38 | 6 | xxxxxxxxxxxx | Active imported energy, Tariff 1 |
| 39 | 1 | 8E | DIF size, 12 digit BCD |
| 40 | 1 | 20 | DIFE, tariff 2 |
| 41 | 1 | 84 | VIF for units kWh with resolution 0,01kWh |
| 42 | 1 | xx | VIFE status |
| 43-48 | 6 | xxxxxxxxxxxx | Active imported energy, Tariff 2 |
| 49 | 1 | 8E | DIF size, 12 digit BCD |
| 50 | 1 | 30 | DIFE, tariff 3 |
| 51 | 1 | 84 | VIF for units kWh with resolution 0,01kWh |
| 52 | 1 | xx | VIFE status |
| 53-58 | 6 | xxxxxxxxxxxx | Active imported energy, Tariff 3 |
| 59 | 1 | 8E | DIF size, 12 digit BCD |
| 60 | 1 | 80 | DIFE, |
| 61 | 1 | 10 | DIFE, tariff 4 |
| 62 | 1 | 84 | VIF for units kWh with resolution 0,01kWh |
| 63 | 1 | xx | VIFE status |
| 64-69 | 6 | xxxxxxxxxxxx | Active imported energy, Tariff 4 |
| 70 | 1 | 8E | DIF size, 12 digit BCD |
| 71 | 1 | 40 | DIFE, unit 1 |
| 72 | 1 | 84 | VIF for units kWh with resolution 0,01kWh |
| 73 | 1 | xx | VIFE status |
| 74-79 | 6 | xxxxxxxxxxxx | Active exported energy, Total |
| 80 | 1 | 8E | DIF size, 12 digit BCD |
| 81 | 1 | 50 | DIFE, tariff 1, unit 1 |
| 82 | 1 | 84 | VIF for units kWh with resolution $0,01 \mathrm{kWh}$ |
| 83 | 1 | xx | VIFE status |
| 84-89 | 6 | xxxxxxxxxxxx | Active exported energy, Tariff 1 |
| 90 | 1 | 8E | DIF size, 12 digit BCD |
| 91 | 1 | 60 | DIFE, tariff 2, unit 1 |
| 92 | 1 | 84 | VIF for units kWh with resolution 0,01kWh |
| 93 | 1 | xx | VIFE status |
| 94-99 | 6 | xxxxxxxxxxxx | Active exported energy, Tariff 2 |
| 100 | 1 | 8E | DIF size, 12 digit BCD |

| Byte No. | Size | Value | Description |
| :---: | :---: | :---: | :---: |
| 101 | 1 | 70 | DIFE, tariff 3, unit 1 |
| 102 | 1 | 84 | VIF for units kWh with resolution 0,01kWh |
| 103 | 1 | xx | VIFE status |
| 104-109 | 6 | xxxxxxxxxxxx | Active exported energy, Tariff 3 |
| 110 | 1 | 8E | DIF size, 12 digit BCD |
| 111 | 1 | C0 | DIFE, unit 1 |
| 112 | 1 | 10 | DIFE, tariff 4 |
| 113 | 1 | 84 | VIF for units kWh with resolution 0,01kWh |
| 114 | 1 | xx | VIFE status |
| 115-120 | 6 | xxxxxxxxxxxx | Active exported energy, Tariff 4 |
| 121 | 1 | 01 | DIF size, 8 bit integer |
| 122 | 1 | FF | VIF next byte is manufacturer specific |
| 123 | 1 | 93 | VIFE current tariff |
| 124 | 1 | xx | VIFE status |
| 125 | 1 | xx | Current tariff |
| 126 | 1 | 04 | DIF size, 32 bit integer |
| 127 | 1 | FF | VIF next byte is manufacturer specific |
| 128 | 1 | A0 | VIFE CT ratio numerator |
| 129 | 1 | xx | VIFE status |
| 130-133 | 4 | xxxxxxxx | Current transformer ratio numerator |
| 134 | 1 | 04 | DIF size, 32 bit integer |
| 135 | 1 | FF | VIF next byte is manufacturer specific |
| 136 | 1 | A1 | VIFE VT ratio numerator |
| 137 | 1 | xx | VIFE status |
| 138-141 | 4 | xxxxxxxx | Voltage transformer ratio numerator |
| 142 | 1 | 04 | DIF size, 32 bit integer |
| 143 | 1 | FF | VIF next byte is manufacturer specific |
| 144 | 1 | A2 | VIFE CT ratio denominator |
| 145 | 1 | xX | VIFE status |
| 146-149 | 4 | xxxxxxxx | Current transformer ratio denominator |
| 150 | 1 | 04 | DIF size, 32 bit integer |
| 151 | 1 | FF | VIF next byte is manufacturer specific |
| 152 | 1 | A3 | VIFE VT ratio denominator |
| 153 | 1 | xx | VIFE status |
| 154-157 | 4 | xxxxxxxx | Voltage transformer ratio denominator |
| 158 | 1 | 07 | DIF size, 64 bit integer |
| 159 | 1 | FF | VIF next byte is manufacturer specific |
| 160 | 1 | A6 | VIFE error flags (binary) |
| 161 | 1 | xx | VIFE status |
| 162-169 | 8 | xxxxxxxxxxxxxxxx | 64 Error flags |
| 170 | 1 | 07 | DIF size, 64 bit integer |

| Byte No. | Size | Value | Description |
| :---: | :---: | :---: | :---: |
| 171 | 1 | FF | VIF next byte is manufacturer specific |
| 172 | 1 | A7 | VIFE warning flags (binary) |
| 173 | 1 | xx | VIFE status |
| 174-181 | 8 | xxxxxxxxxxxxxxxx | 64 Warning flags |
| 182 | 1 | 07 | DIF size, 64 bit integer |
| 183 | 1 | FF | VIF next byte is manufacturer specific |
| 184 | 1 | A8 | VIFE information flags (binary) |
| 185 | 1 | xx | VIFE status |
| 186-193 | 8 | xxxxxxxxxxxxxxxx | 64 Information flags |
| 194 | 1 | 07 | DIF size, 64 bit integer |
| 195 | 1 | FF | VIF next byte is manufacturer specific |
| 196 | 1 | A9 | VIFE alarm flags (binary) |
| 197 | 1 | xx | VIFE status |
| 198-205 | 8 | xxxxxxxxxxxxxxxx | 64 Alarm flags |
| 206 | 1 | OE | DIF size, 12 digit BCD |
| 207 | 1 | ED | VIF time/date |
| 208 | 1 | xx | VIFE status |
| 209-214 | 6 | xxxxxxxxxxxx | Time and date (sec,min, hour,day,month,year) |
| 215 | 1 | 01 | DIF size, 8 bit integer |
| 216 | 1 | FF | VIF next byte is manufacturer specific |
| 217 | 1 | F9 | VIF extension of manufacturer specific VIFE's, next VIFE specifies actual meaning |
| 218 | 1 | 81 | VIFE DST, day of week, day type, season |
| 219 | 1 | xx | VIFE status |
| 220 | 1 | xX | DST data in bit 0: 1:DST active, 0:DST inactive Day of week data in bit 1-3: 001-111; Monday-Sunday Type of day data in bit 4-5: 00-11; Type of day 1-4 Season data in bit 6-7: 00-11; Season 1-4 |
| 221 | 1 | OD | DIF size, variable length, ASCII coding |
| 222 | 1 | FD | VIF extension of VIF-codes |
| 223 | 1 | 8E | VIFE Firmware |
| 224 | 1 | xx | VIFE status |
| 225 | 1 | $0 \mathrm{C}^{*}$ | Byte specifying length, *see note below |
| 226-237 | 12* | xxxxxxxxxxxxxxxxx <br> xxxxxxx | Firmware version (ASCII coded, LSB byte first), *see note below |
| 238 | 1 | OD | DIF size, variable length, ASCII coding |
| 239 | 1 | FF | VIF next byte is manufacturer specific |
| 240 | 1 | AA | VIFE Type designation |
| 241 | 1 | xx | VIFE status |
| 242 | 1 | OB | Byte specifying length |
| 243-253 | 11 | $\begin{array}{\|l\|} \hline \begin{array}{l} x x x x x x x x x x x x x x x x x \\ \text { xxxxx } \end{array} \\ \hline \end{array}$ | Type designation (ASCII coded, LSB byte first), for example: A44 552-100 |
| 254 | 1 | 1F | DIF, more records will follow in next telegram |

| Byte No. | Size | Value | Description |
| :--- | :--- | :--- | :--- |
| 255 | 1 | xx | CS checksum, calculated from C field to last data |
| 256 | 1 | 16 | Stop character |

### 10.2.2 Example of 2 nd telegram (all values are hexadecimal)

| Byte No. | Size | Value | Description |
| :---: | :---: | :---: | :---: |
| 1 | 1 | 68 | Start character |
| 2 | 1 | FC | L-field, calculated from C field to last user data |
| 3 | 1 | FC | L-field, repeated |
| 4 | 1 | 68 | Start character |
| 5 | 1 | 08 | C-field, RSP_UD |
| 6 | 1 | xx | A-field, address |
| 7 | 1 | 72 | Cl-field, variable data respond, LSB first |
| 8-11 | 4 | xxxxxxxx | Identification Number, 8 BCD digits |
| 12-13 | 2 | 4204 | Manufacturer: ABB |
| 14 | 1 | 02 | Version |
| 15 | 1 | 02 | Medium, 02 = Electricity |
| 16 | 1 | xx | Number of accesses |
| 17 | 1 | xx | Status |
| 18-19 | 2 | 0000 | Signature (0000 = no encryption) |
| 20 | 1 | 04 | DIF size, 32 bit integer |
| 21 | 1 | FF | VIF next byte is manufacturer specific |
| 22 | 1 | 98 | VIFE Power fail counter |
| 23 | 1 | xx | VIFE status |
| 24-27 | 4 | xxxxxxxx | Power fail counter |
| 28 | 1 | 04 | DIF size, 32 bit integer |
| 29 | 1 | A9 | VIF for units W with resolution 0,01W |
| 30 | 1 | xx | VIFE status |
| 31-34 | 4 | xxxxxxxx | Active power, Total |
| 35 | 1 | 04 | DIF size, 32 bit integer |
| 36 | 1 | A9 | VIF for units W with resolution 0,01W |
| 37 | 1 | FF | VIFE next byte is manufacturer specific |
| 38 | 1 | 81 | VIFE L1 |
| 39 | 1 | xx | VIFE status |
| 40-43 | 4 | xxxxxxxx | Active power, L1 |
| 44 | 1 | 04 | DIF size, 32 bit integer |
| 45 | 1 | A9 | VIF for units W with resolution 0,01W |
| 46 | 1 | FF | VIFE next byte is manufacturer specific |
| 47 | 1 | 82 | VIFE L2 |
| 48 | 1 | xx | VIFE status |
| 49-52 | 4 | xxxxxxxx | Active power, L2 |
| 53 | 1 | 04 | DIF size, 32 bit integer |

| Byte No. | Size | Value | Description |
| :---: | :---: | :---: | :---: |
| 54 | 1 | A9 | VIF for units W with resolution 0,01W |
| 55 | 1 | FF | VIFE next byte is manufacturer specific |
| 56 | 1 | 83 | VIFE L3 |
| 57 | 1 | xx | VIFE status |
| 58-61 | 4 | xxxxxxxx | Active power, L3 |
| 62 | 1 | 84 | DIF size, 32 bit integer |
| 63 | 1 | 80 | DIFE (Unit = 0) |
| 64 | 1 | 40 | DIFE (Unit = 1, => xx10 (2)) |
| 65 | 1 | A9 | VIF for units var with resolution 0,01var |
| 66 | 1 | xx | VIFE status |
| 67-70 | 4 | xxxxxxxx | Reactive power, Total |
| 71 | 1 | 84 | DIF size, 32 bit integer |
| 72 | 1 | 80 | DIFE (Unit = 0) |
| 73 | 1 | 40 | DIFE (Unit = 1, => xx10 (2)) |
| 74 | 1 | A9 | VIF for units var with resolution 0,01var |
| 75 | 1 | FF | VIFE next byte is manufacturer specific |
| 76 | 1 | 81 | VIFE L1 |
| 77 | 1 | xx | VIFE status |
| 78-81 | 4 | xxxxxxxx | Reactive power, L1 |
| 82 | 1 | 84 | DIF size, 32 bit integer |
| 83 | 1 | 80 | DIFE (Unit = 0) |
| 84 | 1 | 40 | DIFE (Unit = 1, => xx10 (2)) |
| 85 | 1 | A9 | VIF for units var with resolution 0,01var |
| 86 | 1 | FF | VIFE next byte is manufacturer specific |
| 87 | 1 | 82 | VIFE L2 |

| 80 | 1 | $x x$ | CS checksum, calculated from C field to last data |
| 81 | 1 | 16 | Stop character |

### 10.3 Special Readout of Meter Data

## Introduction

## Readable data

Date, date/time format

Note - An NKE should always be sent before sending any of the commands described below. If the meter is in the middle of another special data readout process it will not respond correctly to the command.

After reading the first telegram, it is possible to continue reading by sending reprated REQ_UD2 commands

If the data item that has been read is normal and without any specific status associated with it, no status-VIFE or 0 will be sent out. If the status is "data error" or "no data available", the standard M-Bus status coding will be sent out (18 hex or 15 hex).
Some data in the meter can only be read by first sending a SND_UD followed by a REQ_UD2.

The data that can be read in this way is:

- Load profile
- Demand
- Previous values
- Logs
- Harmonics

In some cases data specifying date or date/time is contained in the read request command.

The format for date used in the commands is M-Bus data type G:

| Day in bits 0-4 | Valid values 1-31 |
| :--- | :--- |
| Months in bits 8-11 | Valid values 1-12 |
| Year in bits 5-7 and 12-15 (bits 5-7 are the LSB bits) | Valid values 1-99 |

The format for date/time is 6 bytes BCD or M-Bus data type F. M-Bus data type F consists of

| Minutes in bits 0-5 | Valid values 0-59 |
| :--- | :--- |
| Hours in bits 8-12 | Valid values 0-23 |
| Day in bits 16-20 | Valid values 1-31 |
| Months in bits 24-27 | Valid values 1-12 |
| Year in bits 21-23 and 28-31 (MSB bits) | Valid values 0-99 |

If a date or date/time is specified in the command, the meter sends out data for that period. If no data is stored in the meter for the specified period, the meter will
send out data from the nearest date backward in time. Therefore it is recommended that the system should check the date sent in the telegram to verify that it is the requested date. If no data is stored in the meter for the specified date, or for any date backward in time, all data in the telegram will have the status byte marked as "no data available" ( 15 hex).

### 10.3.1 Readout of Load Profile Data

## Read request for a specified date

A read request for a specified date is performed by sending the following SND_UD to the meter followed by a REQ_UD2 (all values are hexadecimal).

| Byte No. | Size | Value | Description |
| :--- | :--- | :--- | :--- |
| 1 | 1 | 68 | Start character |
| 2 | 1 | OA | L-field, calculated from C field to last user data |
| 3 | 1 | 0 A | L-field, repeated |
| 4 | 1 | 68 | Start character |
| 5 | 1 | $53 / 73$ | C-field, SND_UD |
| 6 | 1 | $x x$ | A-field, address |
| 7 | 1 | 51 | Cl-field, data send, LSB first |
| 8 | 1 | 02 | DIF size, 2 byte integer |
| 9 | 1 | EC | VIF time point, date, M-Bus data type G |
| 10 | 1 | FF | VIF next byte is manufacturer specific |
| 11 | 1 | F9 | VIF extension of manufacturer specific VIFE's, next VIFE spec- <br> ifies actual meaning. |

| Byte No. | Size | Value | Description |
| :---: | :---: | :---: | :---: |
| 12 | 1 | XX | VIFE specifies data requested: <br> 10: Active import energy register values at end of interval <br> 11: Active import energy consumption per interval <br> 12: Reactive import energy register values at end of interval <br> 13: Reactive import energy consumption per interval <br> 14: Input 1 register values at end of interval <br> 15: Input 1 number of counts per interval <br> 16: Input 2 register values at end of interval <br> 17: Input 2 number of counts per interval <br> 1C: Active export energy register values at end of interval <br> 1D: Active export energy consumption per interval <br> 1E: Reactive export energy register values at end of interval <br> 1F: Reactive export energy consumption per interval <br> 20: Apparent import energy register values at end of interval <br> 21: Apparent import energy consumption per interval <br> 22: Apparent export energy register values at end of interval <br> 23: Apparent export energy consumption per interval <br> 24: Input 3 register values at end of interval <br> 25: Input 3 number of counts per interval <br> 26: Input 4 register values at end of interval <br> 27: Input 4 number of counts per interval <br> 28: Current average values per interval <br> 29: Voltage average values per interval <br> 2A: THD voltage average values per interval <br> 2B: THD current average values per interval <br> 2C: Power factor average values per interval |
| 13-14 | 2 | xxxx | Date (M-Bus data type G, LSB byte sent first) |
| 15 | 1 | xx | CS checksum, calculated from C field to last data |
| 16 | 1 | 16 | Stop character |

## Read request for a specified date and time

A read request for a specified time is performed by sending the following SND_UD to the meter followed by a REQ_UD2 (all values are hexadecimal).

| Byte No. | Size | Value | Description |
| :--- | :--- | :--- | :--- |
| 1 | 1 | 68 | Start character |
| 2 | 1 | 0 E | L-field, calculated from C field to last user data |
| 3 | 1 | 0 E | L-field, repeated |
| 4 | 1 | 68 | Start character |
| 5 | 1 | $53 / 73$ | C-field, SND_UD |
| 6 | 1 | xx | A-field, address |
| 7 | 1 | 51 | CI-field, data send, LSB first |
| 8 | 1 | $0 E$ | DIF size, 12 digit BCD data |
| 9 | 1 | ED | VIF time point, date, M-Bus data type G |
| 10 | 1 | FF | VIF next byte is manufacturer specific |
| 11 | 1 | F9 | VIF extension of manufacturer specific VIFE's, next VIFE spec- <br> ifies actual meaning. |

| Byte No. | Size | Value | Description |
| :---: | :---: | :---: | :---: |
| 12 | 1 | xx | VIFE specifies data requested: <br> 10: Active import energy register values at end of interval <br> 11: Active import energy consumption per interval <br> 12: Reactive import energy register values at end of interval <br> 13: Reactive import energy consumption per interval <br> 14: Input 1 register values at end of interval <br> 15: Input 1 number of counts per interval <br> 16: Input 2 register values at end of interval <br> 17: Input 2 number of counts per interval <br> 1C: Active export energy register values at end of interval <br> 1D: Active export energy consumption per interval <br> 1E: Reactive export energy register values at end of interval <br> 1F: Reactive export energy consumption per interval <br> 20: Apparent import energy register values at end of interval <br> 21: Apparent import energy consumption per interval <br> 22: Apparent export energy register values at end of interval <br> 23: Apparent export energy consumption per interval <br> 24: Input 3 register values at end of interval <br> 25: Input 3 number of counts per interval <br> 26: Input 4 register values at end of interval <br> 27: Input 4 number of counts per interval <br> 28: Current average values per interval <br> 29: Voltage average values per interval <br> 2A: THD voltage average values per interval <br> 2B: THD current average values per interval <br> 2C: Power factor average values per interval |
| 13-18 | 6 | xxxxxxxxxxxx | Time/date (sec:min:hour / day-month-year) |
| 19 | 1 | xx | CS checksum, calculated from C field to last data |
| 20 | 1 | 16 | Stop character |

Read request for load profile, quantities with phase no. specified
A read request for a load profile, quantities with phase no. specified is performed by sending the following SND_UD to the meter followed by a REQ_UD2 (all values are hexadecimal).

| Byte No. | Size | Value | Description |
| :--- | :--- | :--- | :--- |
| 1 | 1 | 68 | Start character |
| 2 | 1 | 10 | L-field, calculated from C field to last user data |
| 3 | 1 | 10 | L-field, repeated |
| 4 | 1 | 68 | Start character |
| 5 | 1 | $53 / 73$ | C-field, SND_UD |
| 6 | 1 | xx | A-field, address |
| 7 | 1 | 51 | CI-field, data send, LSB first |
| 8 | 1 | $0 E$ | DIF size, 12 digit BCD data |
| 9 | 1 | ED | VIF time point, date and time |
| 10 | 1 | FF | VIF next byte is manufacturer specific |
| 11 | 1 | F9 | VIF extension of manufacturer specific VIFE's, next VIFE spec- <br> ifies actual meaning. |

| Byte No. | Size | Value | Description |
| :---: | :---: | :---: | :---: |
| 12 | 1 | xx | VIFE specifies data requested: <br> 10: Active import energy register values at end of interval <br> 11: Active import energy consumption per interval <br> 12: Reactive import energy register values at end of interval <br> 13: Reactive import energy consumption per interval <br> 14: Input 1 register values at end of interval <br> 15: Input 1 number of counts per interval <br> 16: Input 2 register values at end of interval <br> 17: Input 2 number of counts per interval <br> 1C: Active export energy register values at end of interval <br> 1D: Active export energy consumption per interval <br> 1E: Reactive export energy register values at end of interval <br> 1F: Reactive export energy consumption per interval <br> 20: Apparent import energy register values at end of interval <br> 21: Apparent import energy consumption per interval <br> 22: Apparent export energy register values at end of interval <br> 23: Apparent export energy consumption per interval <br> 24: Input 3 register values at end of interval <br> 25: Input 3 number of counts per interval <br> 26: Input 4 register values at end of interval <br> 27: Input 4 number of counts per interval <br> 28: Current average values per interval <br> 29: Voltage average values per interval <br> 2A: THD voltage average values per interval <br> 2B: THD current average values per interval <br> 2C: Power factor average values per interval |
| 13 | 1 | FF | Next byte is manufacturer specific |
| 14 | 1 | xX | Entity corresponding to phase nos. L1,L2,L3,L1-L2,L2-L3,L1L3, N |
| 15-20 | 6 | xxxxxxxxxxxx | Time/date (sec:min:hour / day-month-year |
| 21 | 1 | xx | CS checksum, calculated from C field to last data |
| 22 | 1 | 16 | Stop character |

## Read request for load profile with channel no. specified as input

A read request for a load profile with channel no. specified as input is performed by sending the following SND_UD to the meter followed by a REQ_UD2 (all values are hexadecimal).

| Byte No. | Size | Value | Description |
| :--- | :--- | :--- | :--- |
| 1 | 1 | 68 | Start character |
| 2 | 1 | 11 | L-field, calculated from C field to last user data |
| 3 | 1 | 11 | L-field, repeated |
| 4 | 1 | 68 | Start character |
| 5 | 1 | $53 / 73$ | C-field, SND_UD |
| 6 | 1 | xx | A-field, address |
| 7 | 1 | 51 | Cl-field, data send, LSB first |
| 8 | 1 | $0 E$ | DIF size, 12 digit BCD data |
| 9 | 1 | ED | VIF time point, date and time |

| Byte No. | Size | Value | Description |
| :--- | :--- | :--- | :--- |
| 10 | 1 | FF | VIF next byte is manufacturer specific |
| 11 | 1 | F9 | VIF extension of manufacturer specific VIFE's, next VIFE spec- <br> ifies actual meaning. |
| 12 | 1 | B8 | Read load profile data based upon the channel no. specified. <br> Register value will be read |
| 13 | 1 | FF | Next byte is manufacturer specific |
| 14 | 1 | F8 | Next byte is manufacturer specific, used for numbering |
| 15 | 1 | xx | Specifies channel no. where channel nos=>0...7 |
| $16-21$ | 6 | xxxxxxxxxxxx | Time/date (sec:min:hour / day-month-year) |
| 22 | 1 | $x x$ | CS checksum, calculated from C field to last data |
| 23 | 1 | 16 | Stop character |

## Comments

The data is sent out with 12 load profile values in each telegram. This means that 2 telegrams must be read for 1 day of load profile values when the interval length is 60 minutes. If the interval length is 30 minutes 4 telegrams must be read and if the interval length is 15 minutes 8 telegrams must be read.
Beside the interval data the date/time information for the day record and the interval length is sent out.
Reading load profile energy values can be done either as register values, or as consumption per interval values. This is controlled by the VIFE used in the readout request.
When the load profile data is read out as consumption per interval the register value at the start of the 1 :st interval is also sent out. The date/time information is sent out in format M-Bus data type F .

When the load profile data is read out as consumption per interval the date/time information specifies the start of the 1:st interval and the date/time-stamp for the register value in the frame sent out. When the load profile data is read out as register values the date/time information specifies the end of the $1:$ st interval the frame sent out.

The register values have same data and value information bytes (DIF, DIFE's, VIF, VIFE's) as the momentary register values, but with storage number 1 to indicate that it is stored historical data.

If the load profile search type is set to raw format, it is only possible to read register values or average values, i.e., not consumption values per interval. In this case the values stored in the meter are sent out in the order they were stored, starting with the most recent. This means that there may exist duplicate timestamps as well as jumps in time in any direction.

## Status information

The manufacturer specific coding of the status information is used to indicate the following:

- Date/time was changed during the interval
- Data overflow in interval
- Intervals are too long or too short
- Power outage occurred during the interval

If one or several of these status events occur during an interval, the extra VIFE's FF FE $0 x$ are sent out, where $x$ is a bit 4-0 and have the following meaning if set:

| Bit 4 | Date/time was changed during the interva |
| :--- | :--- |
| Bit 3 | Data overflow in interval |
| Bit 2 | Power outage occurred during interval |
| Bit 1 | Short interval |
| Bit 0 | Long interval |

### 10.3.1.1 Examples of Readouts of Load Profile Data

Introduction In the following are a number of practical examples of load profile readouts. All data is hexadecimal and comments are preceded by a semicolon.

### 10.3.2 Readout of Demand Data

Read request A read request is performed by sending the following SND_UD to the meter followed by a REQ_UD2 (all values are hexadecimal).

| Byte No. | Size | Value | Description |
| :--- | :--- | :--- | :--- |
| 1 | 1 | 68 | Start character |
| 2 | 1 | OA | L-field, calculated from C field to last user data |
| 3 | 1 | OA | L-field, repeated |
| 4 | 1 | 68 | Start character |
| 5 | 1 | $53 / 73$ | C-field, SND_UD |
| 6 | 1 | $x x$ | A-field, address |
| 7 | 1 | 51 | CI-field, data send, LSB first |
| 8 | 1 | 02 | DIF size, 2 byte integer |
| 9 | 1 | EC | VIF time point, date, M-Bus data type G |
| 10 | 1 | FF | VIF next byte is manufacturer specific |
| 11 | 1 | F9 | VIF extension of manufacturer specific VIFE's, next <br> VIFE specifies actual meaning. |

| Byte No. | Size | Value | Description |
| :--- | :--- | :--- | :--- |
| 12 | 1 | 18 | VIFE specifies maximum demand |
| $13-14$ | 2 | xxxx | Date (M-Bus data type G, LSB byte sent first) |
| 15 | 1 | $x x$ | CS checksum, calculated from C field to last data |
| 16 | 1 | 16 | Stop character |

## Comments

The demand data stored for a measured period is sent out in one or more telegrams depending on the number of chennels that are used. The data that is sent out is interval length, demand values for all channels and a date/time stamp for the end of the measured period. Each demand value is also followed by the date/time stamp for the end of the interval in which the minimum/maximum occured.

The date/time information is sent out in format 6 byte BCD in order second, minute, hour, day, month and year.

The data for the currently pending period will be sent out with storage number set to 0 , the most recent stored historical values will have storage number 1 , the next set of historical values will have storage number 2 etc.

If data have not been generated for a quantity the demand value is set to 0 and the date/time is set to $00-00-00 / 00: 00: 00$. This is the case for the currently pending period before any demand have been stored, that is while the very first interval in a measurement period is pending. It will also happen if a particular tariff has not been active in a measurement period.

### 10.3.2.1 Examples of Readouts of Demand Data

Introduction In the following is a number of commented practical examples of demand data. All data is in hexadecimal format. Comments are preceded by a semicolon.

The examples contain only maximum values. For minimum values the function field in the DIF is set to 10 hex instead of 01 hex.

## Readout of demand data

System sends read request command for demand:

```
6 8 ~ O A ~ O A ~ 6 8 ~ 7 3 ~ F E ~ 5 1 ~ 0 2 ~ E C ~ F F ~ F 9 ~ 1 8 ~ C 1 ~ 0 7 ~ 8 8 ~ 1 6 ~
```

Meter sends out acknowledge: E5

System sends out request UD2:

```

\end{tabular}

\section*{Comments}

Previous values data for all channels that is stored at the end of a period is sent out in one or more telegrams depending on the number of channels that are used. The most recent values are sent out first having storage number 1, then the second most recently stored values with storage number 2 and so on until all stored perevitus values have been read. Beside the previous register values a date/time stamp for the end of the period is sent out in the telegram. The date/time information is sent out in format 6 byte BCD in order second, minute, hour, day, month and year.

Note - Previous values are also sent out in a normal readout sequence. This sequence takes it start after the default telegrams that contain current values of energy registers, instrumentation values, etc...

\subsection*{10.3.4 Readout of Event Log Data}

\section*{Read request}

Each one of the existing logs can be read by sending the following SND_UD to the meter followed by a REQ_UD2 (all values are hexadecimal).
\begin{tabular}{|l|l|l|l|}
\hline Byte No. & Size & Value & Description \\
\hline 1 & 1 & 68 & Start character \\
\hline 2 & 1 & 12 & L-field, calculated from C field to last user data \\
\hline 3 & 1 & 12 & L-field, repeated \\
\hline 4 & 1 & 68 & Start character \\
\hline 5 & 1 & \(53 / 73\) & C-field, SND_UD \\
\hline 6 & 1 & \(x x\) & A-field, address \\
\hline 7 & 1 & 51 & CI-field, data send, LSB first \\
\hline 8 & 1 & 8 E or EC & DIF size, 6 byte BCD, storage number bit 0 is 0 or 1 \\
\hline 9 & 1 & \(8 x\) or Cx & DIFE storage number bits \(1-4\), unit bit 6 is 0 or 1 \\
\hline 10 & 1 & \(8 x\) & DIFE storage number bits \(5-8\) \\
\hline 11 & 1 & \(8 x\) & DIFE storage number bits \(9-12\) \\
\hline 12 & 1 & \(0 x\) & DIFE storage number bits \(13-16\) \\
\hline 13 & 2 & ED & VIF time/date \\
\hline 14 & 1 & FF & VIF next byte is manufacturer specific \\
\hline 15 & 1 & F9 & \begin{tabular}{l} 
VIF extension of manufacturer specific VIFE's, next \\
VIFE specifies actual meaning.
\end{tabular} \\
\hline 16 & 1 & 1 A & \begin{tabular}{l} 
VIFE Specification for different Logs: \\
System Log \(=0 \times 2 e\)
\end{tabular} \\
Audit Log \(0 \times 2 \mathrm{f}\) \\
Net Quality Log \(=0 \times 30\) \\
Settings Log = 0x31 \\
Event Log \(=0 \times 32\)
\end{tabular}

\section*{Event Offset}

The meter supports offset values 0 and -1 for reading the System, Event, Audit, Net Quality and Settings logs. If the offset mentioned is 0 then meter will read the
\(\log\) in the forward direction. If the offset value mentioned is -1 then it will read the data in the backward direction from the given date.

Data
The data will be sent out with 5 events in each telegram. If less than 5 events is stored in the meter for the specified date/time and offset all data in the telegram after the last stored event will have status byte marked as "no data available" (15 hex).

The data sent out for each event is:
- Event type (1 byte binary coded).
- Date/time stamp for start of the event (6 byte bcd in order sec:min:hour/ day:month:year
- Duration of the event (in seconds)

\subsection*{10.3.4.1 Example of readout of log data}

specifies actual meaning
\end{tabular} \\
\hline 11 & 1 & \(1 B\) & VIFE specifies current harmonics \\
\hline 12 & 1 & xx & Phase number 1-3 \\
\hline 13 & 1 & xx & CS checksum, calculated from C field to last data \\
\hline 14 & 1 & 16 & Stop character \\
\hline
\end{tabular}

\section*{About the data sent out}

The meter will send out harmonic data for one phase in each telegram, which means 3 telegrams in a 3 -element meter, 2 telegrams in a 2 -element meter and 1 telegram in a single phase meter.

Data sent out will be the total harmonic distortion and the harmonics measured, normally those with numbers \(2-16\). Note that the total harmonic distortion is calculated from the harmonics measured and is thus not the true total harmonic dis-
tortion, which would require all harmonics (up to infinite frequency) to be measured.

Note - Data may temporarily be marked "not available" if there are disturbances on the net (for example due to short voltage dips) making the frequency measurement invalid. Also directly after startup all harmonics will be marked "not available" as they haven't been measured yet. As the harmonics are measured sequentially one at a time they will be available one by one.

\subsection*{10.3.5.1 Examples of Readouts of Current Harmonics Data}

\section*{Comments}

In the following are 2 examples of readouts of current harmonics data. The second example, which is in telegram format, is commented. The comments are preceded by semicolon. The data in both telegrams is hexadecimal.

\section*{Example 1 The readout contains the following data:}

\begin{tabular}{|c|c|c|c|}

\subsection*{10.3.6 Readout of Voltage Harmonics}

\section*{Read request A read request for voltage harmonics is performed by sending the following} SND_UD to the meter followed by a REQ_UD2 (all values are hexadecimal).
\begin{tabular}{|l|l|l|l|}
\hline Byte No. & Size & Value & Description \\
\hline 1 & 1 & 68 & Start character \\
\hline 2 & 1 & 07 & L-field, calculated from C field to last user data \\
\hline 3 & 1 & 07 & L-field, repeated \\
\hline 4 & 1 & 68 & Start character \\
\hline 5 & 1 & \(53 / 73\) & C-field, SND_UD \\
\hline 6 & 1 & \(x x\) & A-field, address \\
\hline 7 & 1 & 51 & Cl-field, data send, LSB first \\
\hline 8 & 1 & 00 & DIF size, no data \\
\hline 9 & 1 & FF & VIF next byte is manufacturer specific \\
\hline 10 & 1 & F9 & \begin{tabular}{l} 
VIF extension of manufacturer specific VIFE's, next VIFE \\
specifies actual meaning
\end{tabular} \\
\hline 11 & 1 & \(2 D\) & VIFE specifies voltage harmonics \\
\hline 12 & 1 & \(x x\) & CS checksum, calculated from C field to last data \\
\hline 13 & 2 & 16 & Stop character \\
\hline
\end{tabular}

\section*{Read request for a specific phase}

A read request for a specific phase is performed by sending the following SND_UD to the meter followed by a REQ_UD2 (all values are hexadecimal).
\begin{tabular}{|l|l|l|l|}
\hline Byte No. & Size & Value & Description \\
\hline 1 & 1 & 68 & Start character \\
\hline 2 & 1 & 08 & L-field, calculated from C field to last user data \\
\hline 3 & 1 & 08 & L-field, repeated \\
\hline 4 & 1 & 68 & Start character \\
\hline 5 & 1 & \(53 / 73\) & C-field, SND_UD \\
\hline 6 & 1 & xx & A-field, address \\
\hline 7 & 1 & 51 & Cl-field, data send, LSB first \\
\hline 8 & 1 & 01 & DIF size, 8 bit integer \\
\hline 9 & 1 & FF & VIF next byte is manufacturer specific \\
\hline 10 & 1 & F9 & \begin{tabular}{l} 
VIF extension of manufacturer specific VIFE's, next VIFE \\
specifies actual meaning
\end{tabular} \\
\hline 11 & 1 & \(2 D\) & VIFE specifies voltage harmonics \\
\hline 12 & 1 & xx & Phase number 1-3 \\
\hline 13 & 1 & xx & CS checksum, calculated from C field to last data \\
\hline 14 & 1 & 16 & Stop character \\
\hline
\end{tabular}

\section*{About the data sent out}

The meter will send out harmonic data for one phase in each telegram, which means 3 telegrams in a 3 -element meter, 2 telegrams in a 2 -element meter and 1 telegram in a single phase meter.

Data sent out will be the total harmonic distortion and the harmonics measured, normally those with numbers 2-16. Note that the total harmonic distortion is calculated from the harmonics measured and is thus not the true total harmonic distortion, which would require all harmonics (up to infinite frequency) to be measured. If any harmonic have frequency above 500 Hz it will not be measured and will be marked "not available".

\subsection*{10.3.6.1 Examples of readout of voltage harmonics data}

Example 1
The readout contains the following data:
\begin{tabular}{|l|l|l|l|}
\hline Byte No. & Size & Value & Description \\
\hline 1 & 1 & 68 & Start character \\
\hline 2 & 1 & 73 & L-field, calculated from C field to last user data \\
\hline 3 & 1 & 73 & L-field, repeated \\
\hline 4 & 1 & 68 & Start character \\
\hline 5 & 1 & 08 & C-field, RSP_UD \\
\hline 6 & 1 & xx & A-field, address \\
\hline 7 & 1 & 72 & Cl-field, data send, LSB first \\
\hline \(8-11\) & 4 & xxxxxxxx & identification number, 8 BCD digits \\
\hline \(12-13\) & 2 & 4204 & Manufacturer: ABB \\
\hline 14 & 1 & 05 & Version \\
\hline 15 & 1 & 02 & Medium, 02=electricity \\
\hline 16 & 1 & xx & Number of accesses \\
\hline 17 & 1 & xx & Status \\

\subsection*{10.4 Sending Data to the Meter}

\section*{General \\ This section describes the telegrams that can be sent to an EQ meter. Some of the telegrams contain data, others do not. Data sent in the telegram is sometimes stored in the meter, sometimes used by the meter to perform a certain action. Telegrams that contains no data usually initiates a certain action in the meter.}

Write access level protection

Some of the commands can be protected by a password. There are 3 different levels of write access level protection:
- Open
- Open by password
- Closed

The write access level can be set either via the buttons directly on the meter or via communication using the set write access level command.
If the access level is set to Open, the meter will always accept the command as long as the the meter is properly addressed and the syntax and checksum are correct.

If the accsess level is set to Open by password the specific command sent to the meter must be preceded by a send password command in order for the meter to accept the command.

If the accsess level is set to Closed the meter will not accept any command, but will just return an acknowledge character (E5 hex). To change this access level protection, the access level has to be set to Open via the buttons directly on the meter.

Note - Commands that are not affected by the write access level protection only require a correct message with correct address, syntax and checksum to be accepted.

\subsection*{10.4.1 Set tariff}

For meters with tariff control the active tariff is set by sending the following command (all values are hexadecimal). The command is not affected by the write protection level set.
\begin{tabular}{|l|l|l|l|}
\hline Byte No. & Size & Value & Description \\
\hline 1 & 1 & 68 & Start character \\
\hline 2 & 1 & 07 & L-field, calculated from C field to last user data \\
\hline 3 & 1 & 07 & L-field, repeated \\
\hline 4 & 1 & 68 & Start character \\
\hline 5 & 1 & \(53 / 73\) & C-field, SND_UD \\
\hline 6 & 1 & \(x x\) & A-field, address \\
\hline 7 & 1 & 51 & Cl-field, data send, LSB first \\
\hline 8 & 1 & 01 & DIF size, 8 bit integer \\
\hline
\end{tabular}
\begin{tabular}{|l|l|l|l|}
\hline Byte No. & Size & Value & Description \\
\hline 9 & 1 & FF & VIF next byte is manufacturer specific \\
\hline 10 & 1 & 13 & VIFE tariff \\
\hline 11 & 1 & xx & New tariff \\
\hline 12 & 1 & \(x x\) & CS checksum, calculated from C field to last data \\
\hline 13 & 1 & 16 & Stop character \\
\hline
\end{tabular}

\subsection*{10.4.2 Set primary address}

The primary address is set by sending the following command (all values are hexadecimal). The command is not affected by the write protection level set.
\begin{tabular}{|l|l|l|l|}
\hline Byte No. & Size & Value & Description \\
\hline 1 & 1 & 68 & Start character \\
\hline 2 & 1 & 06 & L-field, calculated from C field to last user data \\
\hline 3 & 1 & 06 & L-field, repeated \\
\hline 4 & 1 & 68 & Start character \\
\hline 5 & 1 & \(53 / 73\) & C-field, SND_UD \\
\hline 6 & 1 & xx & A-field, address \\
\hline 7 & 1 & 51 & Cl-field, data send, LSB first \\
\hline 8 & 1 & 01 & DIF size, 8 bit integer \\
\hline 9 & 1 & \(7 A\) & VIFE Bus Address \\
\hline 10 & 1 & xx & New primary address \\
\hline 11 & 1 & xx & CS checksum, calculated from C field to last data \\
\hline 12 & 1 & 16 & Stop character \\
\hline
\end{tabular}

\subsection*{10.4.3 Change baud rate}

The baud rate of the electrical M-Bus interface is set by sending the following command (all values are hexadecimal). The command is not affected by the write protection level set.
\begin{tabular}{|l|l|l|l|}
\hline Byte No. & Size & Value & Description \\
\hline 1 & 1 & 68 & Start character \\
\hline 2 & 1 & 03 & L-field, calculated from C field to last user data \\
\hline 3 & 1 & 03 & L-field, repeated \\
\hline 4 & 1 & 68 & Start character \\
\hline 5 & 1 & \(53 / 73\) & C-field, SND_UD \\
\hline 6 & 1 & xx & A-field, address \\
\hline 7 & 1 & Bx & Cl-field, New baud rate (where x=>8..F) \\
\hline 8 & 1 & xx & CS checksum, calculated from C field to last data \\
\hline 9 & 1 & 16 & Stop character \\
\hline
\end{tabular}

\subsection*{10.4.4 Reset power fail counter}

The power fail counter is reset to 0 by sending the following command (all values are hexadecimal). The command is not affected by the write protection level set.
\begin{tabular}{|l|l|l|l|}
\hline Byte No. & Size & Value & Description \\
\hline 1 & 1 & 68 & Start character \\
\hline 2 & 1 & 07 & L-field, calculated from C field to last user data \\
\hline 3 & 1 & 07 & L-field, repeated \\
\hline 4 & 1 & 68 & Start character \\
\hline 5 & 1 & \(53 / 73\) & C-field, SND_UD \\
\hline 6 & 1 & xx & A-field, address \\
\hline 7 & 1 & 51 & CI-field, data send, LSB first \\
\hline 8 & 1 & 00 & DIF size, no data \\
\hline 9 & 1 & FF & VIF next byte is manufacturer specific \\
\hline 10 & 1 & 98 & VIFE no. of power fails \\
\hline 11 & 1 & 07 & VIFE clear \\
\hline 12 & 1 & xx & CS checksum, calculated from C field to last data \\
\hline 13 & 1 & 16 & Stop character \\
\hline
\end{tabular}

\subsection*{10.4.5 Set Current transformer (CT) ratio - numerator}

The current transformer ratio (CT) numerator is set by sending the following command (all values are hexadecimal). The command is affected by the write protection level set.
\begin{tabular}{|l|l|l|l|}
\hline Byte No. & Size & Value & Description \\
\hline 1 & 1 & 68 & Start character \\
\hline 2 & 1 & 0 a & L-field, calculated from C field to last user data \\
\hline 3 & 1 & 0 a & L-field, repeated \\
\hline 4 & 1 & 68 & Start character \\
\hline 5 & 1 & \(53 / 73\) & C-field, SND_UD \\
\hline 6 & 1 & xx & A-field, address \\
\hline 7 & 1 & 51 & CI-field, data send, LSB first \\
\hline 8 & 1 & 04 & DIF size, 32 bit integer \\
\hline 9 & 1 & FF & VIF next byte is manufacturer specific \\
\hline 10 & 1 & 20 & VIFE CT ratio numerator \\
\hline \(11-14\) & 4 & xxxxxxxx & New CT ratio numerator \\
\hline 15 & 1 & xx & CS checksum, calculated from C field to last data \\
\hline 16 & 1 & 16 & Stop character \\
\hline
\end{tabular}

\subsection*{10.4.6 Set voltage transformer (VT) ratio - numerator}

The voltage transformer ratio (VT) numerator is set by sending the following command (all values are hexadecimal). The command is affected by the write protection level set.
\begin{tabular}{|l|l|l|l|}
\hline Byte No. & Size & Value & Description \\
\hline 1 & 1 & 68 & Start character \\
\hline 2 & 1 & 0 a & L-field, calculated from C field to last user data \\
\hline 3 & 1 & \(0 a\) & L-field, repeated \\
\hline 4 & 1 & 68 & Start character \\
\hline 5 & 1 & \(53 / 73\) & C-field, SND_UD \\
\hline 6 & 1 & xx & A-field, address \\
\hline 7 & 1 & 51 & Cl-field, data send, LSB first \\
\hline 8 & 1 & 04 & DIF size, 32 bit integer \\
\hline 9 & 1 & FF & VIF next byte is manufacturer specific \\
\hline 10 & 1 & 21 & VIFE VT ratio numerator \\
\hline \(11-14\) & 4 & \(x x x x x x x x\) & New VT ratio numerator \\
\hline 15 & 1 & xx & CS checksum, calculated from C field to last data \\
\hline 16 & 1 & 16 & Stop character \\
\hline
\end{tabular}

\subsection*{10.4.7 Set current transformer (CT) ratio - denominator}

The current transformer ratio (CT) denominator is set by sending the following command (all values are hexadecimal). The command is affected by the write protection level set.
\begin{tabular}{|l|l|l|l|}
\hline Byte No. & Size & Value & Description \\
\hline 1 & 1 & 68 & Start character \\
\hline 2 & 1 & \(0 a\) & L-field, calculated from C field to last user data \\
\hline 3 & 1 & \(0 a\) & L-field, repeated \\
\hline 4 & 1 & 68 & Start character \\
\hline 5 & 1 & \(53 / 73\) & C-field, SND_UD \\
\hline 6 & 1 & xx & A-field, address \\
\hline 7 & 1 & 51 & CI-field, data send, LSB first \\
\hline 8 & 1 & 04 & DIF size, 32 bit integer \\
\hline 9 & 1 & FF & VIF next byte is manufacturer specific \\
\hline 10 & 1 & 22 & VIFE CT ratio denominator \\
\hline \(11-14\) & 4 & xxxxxxxx & New CT ratio denominator \\
\hline 15 & 1 & xx & CS checksum, calculated from C field to last data \\
\hline 16 & 1 & 16 & Stop character \\
\hline
\end{tabular}

\subsection*{10.4.8 Set voltage transformer (VT) ratio - denominator}

The current transformer ratio (VT) denominator is set by sending the following command (all values are hexadecimal). The command is affected by the write protection level set.
\begin{tabular}{|l|l|l|l|}
\hline Byte No. & Size & Value & Description \\
\hline 1 & 1 & 68 & Start character \\
\hline 2 & 1 & 0 A & L-field, calculated from C field to last user data \\
\hline 3 & 1 & 0 A & L-field, repeated \\
\hline 4 & 1 & 68 & Start character \\
\hline 5 & 1 & \(53 / 73\) & C-field, SND_UD \\
\hline 6 & 1 & xx & A-field, address \\
\hline 7 & 1 & 51 & Cl-field, data send, LSB first \\
\hline 8 & 1 & 04 & DIF size, 32 bit integer \\
\hline 9 & 1 & FF & VIF next byte is manufacturer specific \\
\hline 10 & 1 & 23 & VIFE VT ratio denominator \\
\hline \(11-14\) & 4 & xx xx xx xx & New VT ratio denominator \\
\hline 15 & 1 & xx & CS checksum, calculated from C field to last data \\
\hline 16 & 1 & 16 & Stop character \\
\hline
\end{tabular}

\subsection*{10.4.9 Select status information}

To change the way the status information is sent out the following command is sent (all values are hexadecimal). The command is not affected by the write protection level set.
\begin{tabular}{|l|l|l|l|}
\hline Byte No. & Size & Value & Description \\
\hline 1 & 1 & 68 & Start character \\
\hline 2 & 1 & 07 & L-field, calculated from C field to last user data \\
\hline 3 & 1 & 07 & L-field, repeated \\
\hline 4 & 1 & 68 & Start character \\
\hline 5 & 1 & \(53 / 73\) & C-field, SND_UD \\
\hline 6 & 1 & \(x x\) & A-field, address \\
\hline 7 & 1 & 51 & CI-field, data send, LSB first \\
\hline 8 & 1 & 01 & DIF size, 8 bit integer \\
\hline 9 & 1 & FF & VIF next byte is manufacturer specific \\
\hline 10 & 1 & 15 & VIFE status of values (status byte on the values) \\
\hline 11 & 1 & xx & \(0=\) never, \(1=\) status if not OK=always \\
\hline 12 & 1 & xx & CS checksum, calculated from C field to last data \\
\hline 13 & 1 & 16 & Stop character \\
\hline
\end{tabular}

\subsection*{10.4.10 Reset of stored state for input 1}

Reset of stored state for input 1 is performed by sending the following command (all values are hexadecimal). The command is not affected by the write protection level set.
\begin{tabular}{|l|l|l|l|}
\hline Byte No. & Size & Value & Description \\
\hline 1 & 1 & 68 & Start character \\
\hline 2 & 1 & 08 & L-field, calculated from C field to last user data \\
\hline 3 & 1 & 08 & L-field, repeated \\
\hline 4 & 1 & 68 & Start character \\
\hline 5 & 1 & \(53 / 73\) & C-field, SND_UD \\
\hline 6 & 1 & xx & A-field, address \\
\hline 7 & 1 & 51 & Cl-field, data send, LSB first \\
\hline 8 & 1 & C0 & DIF size, no data, storage number 1 \\
\hline 9 & 1 & 40 & DIFE unit=1 \\
\hline 10 & 1 & FD & VIF extension of VIF codes \\
\hline 11 & 1 & \(9 B\) & VIFE digital input \\
\hline 12 & 1 & 07 & VIFE clear \\
\hline 13 & 1 & xx & CS checksum, calculated from C field to last data \\
\hline 14 & 1 & 16 & Stop character \\
\hline
\end{tabular}

\subsection*{10.4.11 Reset of stored state for input 2}

Reset of stored state for input 2 is performed by sending the following command (all values are hexadecimal). The command is not affected by the write protection level set.
\begin{tabular}{|l|l|l|l|}
\hline Byte No. & Size & Value & Description \\
\hline 1 & 1 & 68 & Start character \\
\hline 2 & 1 & 09 & L-field, calculated from C field to last user data \\
\hline 3 & 1 & 09 & L-field, repeated \\
\hline 4 & 1 & 68 & Start character \\
\hline 5 & 1 & \(53 / 73\) & C-field, SND_UD \\
\hline 6 & 1 & xx & A-field, address \\
\hline 7 & 1 & 51 & Cl-field, data send, LSB first \\
\hline 8 & 1 & C0 & DIF size, no data, storage number 1 \\
\hline 9 & 1 & 80 & DIFE unit=0 \\
\hline 10 & 1 & 40 & DIFE unit=2 \\
\hline 11 & 1 & FD & VIF extension of VIF codes \\
\hline 12 & 1 & \(9 B\) & VIFE digital input \\
\hline 13 & 1 & 07 & VIFE clear \\
\hline 14 & 1 & xx & CS checksum, calculated from C field to last data \\
\hline 15 & 1 & 16 & Stop character \\
\hline
\end{tabular}

\subsection*{10.4.12 Reset of stored state for input 3}

Reset of stored state for input 3 is performed by sending the following command (all values are hexadecimal). The command is not affected by the write protection level set.
\begin{tabular}{|l|l|l|l|}
\hline Byte No. & Size & Value & Description \\
\hline 1 & 1 & 68 & Start character \\
\hline 2 & 1 & 09 & L-field, calculated from C field to last user data \\
\hline 3 & 1 & 09 & L-field, repeated \\
\hline 4 & 1 & 68 & Start character \\
\hline 5 & 1 & \(53 / 73\) & C-field, SND_UD \\
\hline 6 & 1 & xx & A-field, address \\
\hline 7 & 1 & 51 & CI-field, data send, LSB first \\
\hline 8 & 1 & C0 & DIF size, no data, storage number 1 \\
\hline 9 & 1 & C0 & DIFE unit=1 \\
\hline 10 & 1 & 40 & DIFE unit=2 \\
\hline 11 & 1 & FD & VIF extension of VIF codes \\
\hline 12 & 1 & \(9 B\) & VIFE digital input \\
\hline 13 & 1 & 07 & VIFE clear \\
\hline 14 & 1 & xx & CS checksum, calculated from C field to last data \\
\hline 15 & 1 & 16 & Stop character \\
\hline
\end{tabular}

\subsection*{10.4.13 Reset of stored state for input 4}

Reset of stored state for input 4 is performed by sending the following command (all values are hexadecimal). The command is not affected by the write protection level set.
\begin{tabular}{|l|l|l|l|}
\hline Byte No. & Size & Value & Description \\
\hline 1 & 1 & 68 & Start character \\
\hline 2 & 1 & 0 A & L-field, calculated from C field to last user data \\
\hline 3 & 1 & 0 A & L-field, repeated \\
\hline 4 & 1 & 68 & Start character \\
\hline 5 & 1 & \(53 / 73\) & C-field, SND_UD \\
\hline 6 & 1 & xx & A-field, address \\
\hline 7 & 1 & 51 & CI-field, data send, LSB first \\
\hline 8 & 1 & C0 & DIF size, no data, storage number 1 \\
\hline 9 & 1 & 80 & DIFE unit=0 \\
\hline 10 & 1 & 80 & DIFE unit=0 \\
\hline 11 & 1 & 40 & DIFE unit=4 \\
\hline 12 & 1 & FD & VIF extension of VIF codes \\
\hline 13 & 1 & \(9 B\) & VIFE digital input \\
\hline 14 & 1 & 07 & VIFE clear \\
\hline 15 & 1 & xx & CS checksum, calculated from C field to last data \\
\hline 16 & 1 & 16 & Stop character \\
\hline
\end{tabular}

\subsection*{10.4.14 Reset of input counter 1}

Reset of input counter 1 is performed by sending the following command (all values are hexadecimal). The command is not affected by the write protection level set.
\begin{tabular}{|l|l|l|l|}
\hline Byte No. & Size & Value & Description \\
\hline 1 & 1 & 68 & Start character \\
\hline 2 & 1 & 08 & L-field, calculated from C field to last user data \\
\hline 3 & 1 & 08 & L-field, repeated \\
\hline 4 & 1 & 68 & Start character \\
\hline 5 & 1 & \(53 / 73\) & C-field, SND_UD \\
\hline 6 & 1 & xx & A-field, address \\
\hline 7 & 1 & 51 & CI-field, data send, LSB first \\
\hline 8 & 1 & C0 & DIF size, no data \\
\hline 9 & 1 & 40 & DIFE unit=1 \\
\hline 10 & 1 & FD & VIF extension of VIF codes \\
\hline 11 & 1 & \(9 B\) & VIFE cumulating counters \\
\hline 12 & 1 & 07 & VIFE clear \\
\hline 13 & 1 & xx & CS checksum, calculated from C field to last data \\
\hline 14 & 1 & 16 & Stop character \\
\hline
\end{tabular}

\subsection*{10.4.15 Reset of input counter 2}

Reset of input counter 2 is performed by sending the following command (all values are hexadecimal). The command is not affected by the write protection level set.
\begin{tabular}{|l|l|l|l|}
\hline Byte No. & Size & Value & Description \\
\hline 1 & 1 & 68 & Start character \\
\hline 2 & 1 & 09 & L-field, calculated from C field to last user data \\
\hline 3 & 1 & 09 & L-field, repeated \\
\hline 4 & 1 & 68 & Start character \\
\hline 5 & 1 & \(53 / 73\) & C-field, SND_UD \\
\hline 6 & 1 & \(x x\) & A-field, address \\
\hline 7 & 1 & 51 & Cl-field, data send, LSB first \\
\hline 8 & 1 & 80 & DIF size, no data \\
\hline 9 & 1 & 80 & DIFE unit=0 \\
\hline 10 & 1 & 40 & DIFE unit=2 \\
\hline 11 & 1 & FD & VIF extension of VIF codes \\
\hline 12 & 1 & E1 & VIFE cumulating counters \\
\hline 13 & 1 & 07 & VIFE clear \\
\hline 14 & 1 & \(x x\) & CS checksum, calculated from C field to last data \\
\hline 15 & 1 & 16 & Stop character \\
\hline
\end{tabular}

\subsection*{10.4.16 Reset of input counter 3}

Reset of input counter 3 is performed by sending the following command (all values are hexadecimal). The command is not affected by the write protection level set.
\begin{tabular}{|l|l|l|l|}
\hline Byte No. & Size & Value & Description \\
\hline 1 & 1 & 68 & Start character \\
\hline 2 & 1 & 09 & L-field, calculated from C field to last user data \\
\hline 3 & 1 & 09 & L-field, repeated \\
\hline 4 & 1 & 68 & Start character \\
\hline 5 & 1 & \(53 / 73\) & C-field, SND_UD \\
\hline 6 & 1 & xx & A-field, address \\
\hline 7 & 1 & 51 & CI-field, data send, LSB first \\
\hline 8 & 1 & 80 & DIF size, no data \\
\hline 9 & 1 & C0 & DIFE unit=1 \\
\hline 10 & 1 & 40 & DIFE unit=2 \\
\hline 11 & 1 & FD & VIF extension of VIF codes \\
\hline 12 & 1 & E1 & VIFE cumulating counters \\
\hline 13 & 1 & 07 & VIFE clear \\
\hline 14 & 1 & xx & CS checksum, calculated from C field to last data \\
\hline 15 & 1 & 16 & Stop character \\
\hline
\end{tabular}

\subsection*{10.4.17 Reset of input counter 4}

Reset of input counter 4 is performed by sending the following command (all values are hexadecimal). The command is not affected by the write protection level set.
\begin{tabular}{|l|l|l|l|}
\hline Byte No. & Size & Value & Description \\
\hline 1 & 1 & 68 & Start character \\
\hline 2 & 1 & 0 A & L-field, calculated from C field to last user data \\
\hline 3 & 1 & 0 A & L-field, repeated \\
\hline 4 & 1 & 68 & Start character \\
\hline 5 & 1 & \(53 / 73\) & C-field, SND_UD \\
\hline 6 & 1 & xx & A-field, address \\
\hline 7 & 1 & 51 & CI-field, data send, LSB first \\
\hline 8 & 1 & 80 & DIF size, no data \\
\hline 9 & 1 & 80 & DIFE unit=0 \\
\hline 10 & 1 & 80 & DIFE unit=0 \\
\hline 11 & 1 & 40 & DIFE unit=4 \\
\hline 12 & 1 & FD & VIF extension of VIF codes \\
\hline 13 & 1 & E1 & VIFE cumulating counters \\
\hline 14 & 1 & 07 & VIFE clear \\
\hline 15 & 1 & xx & CS checksum, calculated from C field to last data \\
\hline 16 & 1 & 16 & Stop character \\
\hline
\end{tabular}

\subsection*{10.4.18 Set output 1}

Setting the state of output 1 is performed by sending the following command (all values are hexadecimal). The command is not affected by the write protection level set.
\begin{tabular}{|l|l|l|l|}
\hline Byte No. & Size & Value & Description \\
\hline 1 & 1 & 68 & Start character \\
\hline 2 & 1 & 08 & L-field, calculated from C field to last user data \\
\hline 3 & 1 & 08 & L-field, repeated \\
\hline 4 & 1 & 68 & Start character \\
\hline 5 & 1 & \(53 / 73\) & C-field, SND_UD \\
\hline 6 & 1 & xx & A-field, address \\
\hline 7 & 1 & 51 & Cl-field, data send, LSB first \\
\hline 8 & 1 & 81 & DIF size, 8 bit integer \\
\hline 9 & 1 & 40 & DIFE unit=1 \\
\hline 10 & 1 & FD & VIF extension of VIF codes \\
\hline 11 & 1 & 1 A & VIFE digital output \\
\hline 12 & 1 & xx & output 1, new state \\
\hline 13 & 1 & xx & CS checksum, calculated from C field to last data \\
\hline 14 & 1 & 16 & Stop character \\
\hline
\end{tabular}

\subsection*{10.4.19 Set output 2}

Setting the state of output 2 is performed by sending the following command (all values are hexadecimal). The command is not affected by the write protection level set.
\begin{tabular}{|l|l|l|l|}
\hline Byte No. & Size & Value & Description \\
\hline 1 & 1 & 68 & Start character \\
\hline 2 & 1 & 09 & L-field, calculated from C field to last user data \\
\hline 3 & 1 & 09 & L-field, repeated \\
\hline 4 & 1 & 68 & Start character \\
\hline 5 & 1 & \(53 / 73\) & C-field, SND_UD \\
\hline 6 & 1 & \(x x\) & A-field, address \\
\hline 7 & 1 & 51 & Cl-field, data send, LSB first \\
\hline 8 & 1 & 81 & DIF size, 8 bit integer \\
\hline 9 & 1 & 80 & DIFE unit=0 \\
\hline 10 & 1 & 40 & DIFE unit=2 \\
\hline 11 & 1 & FD & VIF extension of VIF codes \\
\hline 12 & 1 & 1 A & VIFE digital output \\
\hline 13 & 1 & xx & output 2, new state \\
\hline 14 & 1 & xx & CS checksum, calculated from C field to last data \\
\hline 15 & 1 & 16 & Stop character \\
\hline
\end{tabular}

\subsection*{10.4.20 Set output 3}

Setting the state of output 3 is performed by sending the following command (all values are hexadecimal). The command is not affected by the write protection level set.
\begin{tabular}{|l|l|l|l|}
\hline Byte No. & Size & Value & Description \\
\hline 1 & 1 & 68 & Start character \\
\hline 2 & 1 & 09 & L-field, calculated from C field to last user data \\
\hline 3 & 1 & 09 & L-field, repeated \\
\hline 4 & 1 & 68 & Start character \\
\hline 5 & 1 & \(53 / 73\) & C-field, SND_UD \\
\hline 6 & 1 & xx & A-field, address \\
\hline 7 & 1 & 51 & CI-field, data send, LSB first \\
\hline 8 & 1 & 81 & DIF size, 8 bit integer \\
\hline 9 & 1 & C0 & DIFE unit=1 \\
\hline 10 & 1 & 40 & DIFE unit=2 \\
\hline 11 & 1 & FD & VIF extension of VIF codes \\
\hline 12 & 1 & 1 A & VIFE digital output \\
\hline 13 & 1 & xx & output 3, new state \\
\hline 14 & 1 & xx & CS checksum, calculated from C field to last data \\
\hline 15 & 1 & 16 & Stop character \\
\hline
\end{tabular}

\subsection*{10.4.21 Set output 4}

Setting the state of output 4 is performed by sending the following command (all values are hexadecimal). The command is not affected by the write protection level set.
\begin{tabular}{|l|l|l|l|}
\hline Byte No. & Size & Value & Description \\
\hline 1 & 1 & 68 & Start character \\
\hline 2 & 1 & 0 A & L-field, calculated from C field to last user data \\
\hline 3 & 1 & 0 A & L-field, repeated \\
\hline 4 & 1 & 68 & Start character \\
\hline 5 & 1 & \(53 / 73\) & C-field, SND_UD \\
\hline 6 & 1 & xx & A-field, address \\
\hline 7 & 1 & 51 & CI-field, data send, LSB first \\
\hline 8 & 1 & 81 & DIF size, 8 bit integer \\
\hline 9 & 1 & 80 & DIFE unit=0 \\
\hline 10 & 1 & 80 & DIFE unit=0 \\
\hline 11 & 1 & 40 & DIFE unit=4 \\
\hline 12 & 1 & FD & VIF extension of VIF codes \\
\hline 13 & 1 & 1 A & VIFE digital output \\
\hline 14 & 1 & xx & output 4, new state \\
\hline 15 & 1 & xx & CS checksum, calculated from C field to last data \\
\hline 16 & 1 & 16 & Stop character \\
\hline
\end{tabular}

\subsection*{10.4.22 Reset power outage time}

Reset of power outage time is performed by sending the following command (all values are hexadecimal). The command is not affected by the write protection level set.
\begin{tabular}{|l|l|l|l|}
\hline Byte No. & Size & Value & Description \\
\hline 1 & 1 & 68 & Start character \\
\hline 2 & 1 & 07 & L-field, calculated from C field to last user data \\
\hline 3 & 1 & 07 & L-field, repeated \\
\hline 4 & 1 & 68 & Start character \\
\hline 5 & 1 & \(53 / 73\) & C-field, SND_UD \\
\hline 6 & 1 & xx & A-field, address \\
\hline 7 & 1 & 51 & Cl-field, data send, LSB first \\
\hline 8 & 1 & 00 & DIF size, no data \\
\hline 9 & 1 & FF & VIF next byte is manufacturer specific \\
\hline 10 & 1 & EC & VIFE power outage time \\
\hline 11 & 1 & 07 & VIFE clear \\
\hline 12 & 1 & xx & CS checksum, calculated from C field to last data \\
\hline 13 & 1 & 16 & Stop character \\
\hline
\end{tabular}

\subsection*{10.4.23 Send password}

Password is sent with the following command (all values are hexadecimal).
\begin{tabular}{|l|l|l|l|}
\hline Byte No. & Size & Value & Description \\
\hline 1 & 1 & 68 & Start character \\
\hline 2 & 1 & 0 E & L-field, calculated from C field to last user data \\
\hline 3 & 1 & 0 E & L-field, repeated \\
\hline 4 & 1 & 68 & Start character \\
\hline 5 & 1 & \(53 / 73\) & C-field, SND_UD \\
\hline 6 & 1 & Xx & A-field, address \\
\hline 7 & 1 & 51 & Cl-field, data send, LSB first \\
\hline 8 & 1 & 07 & DIF size, 8 byte integer \\
\hline 9 & 1 & FD & VIF extension of VIF codes \\
\hline 10 & 1 & 16 & VIFE password \\
\hline \(11-18\) & 8 & xxxxxxxxxxxxxxxx & Password \\
\hline 19 & 1 & \(x x\) & CS checksum, calculated from C field to last data \\
\hline 20 & 1 & 16 & Stop character \\
\hline
\end{tabular}

\subsection*{10.4.24 Set password}

Password is set by sending the following command (all values are hexadecimal).
Note - If the meter is password protected the old password must be sent before a new can be set.
\begin{tabular}{|l|l|l|l|}
\hline Byte No. & Size & Value & Description \\
\hline 1 & 1 & 68 & Start character \\
\hline 2 & 1 & 0 F & L-field, calculated from C field to last user data \\
\hline 3 & 1 & 0 F & L-field, repeated \\
\hline 4 & 1 & 68 & Start character \\
\hline 5 & 1 & \(53 / 73\) & C-field, SND_UD \\
\hline 6 & 1 & \(x x\) & A-field, address \\
\hline 7 & 1 & 51 & Cl-field, data send, LSB first \\
\hline 8 & 1 & 07 & DIF size, 8 byte integer \\
\hline 9 & 1 & FD & VIF extension of VIF codes \\
\hline 10 & 1 & 96 & VIFE password \\
\hline 11 & 1 & 00 & VIFE write (replace) \\
\hline \(12-19\) & 8 & \(x x x x x x x x x x x x x x x x\) & Password \\
\hline 20 & 1 & \(x x\) & CS checksum, calculated from C field to last data \\
\hline 21 & 1 & 16 & Stop character \\
\hline
\end{tabular}

\subsection*{10.4.25 Set date and time}

Date and time is set by sending the following command (all values are hexadecimaI). The command not affected by the write protection level set.

Note - Before sending the command an NKE should be sent. If the meter is in the middle of a special data readout process it will not respond to the set date and time command.
\begin{tabular}{|l|l|l|l|}
\hline Byte No. & Size & Value & Description \\
\hline 1 & 1 & 68 & Start character \\
\hline 2 & 1 & OB & L-field, calculated from C field to last user data \\
\hline 3 & 1 & \(0 B\) & L-field, repeated \\
\hline 4 & 1 & 68 & Start character \\
\hline 5 & 1 & \(53 / 73\) & C-field, SND_UD \\
\hline 6 & 1 & xx & A-field, address \\
\hline 7 & 1 & 51 & Cl-field, data send, LSB first \\
\hline 8 & 1 & \(0 E\) & DIF size, 12 digit BCD \\
\hline 9 & 1 & \(6 D\) & VIF time/date \\
\hline \(10-15\) & 6 & xxxxxxxxxxxx & Time and date (sec, min, hour, day, month, year) \\
\hline 16 & 1 & xx & CS checksum, calculated from C field to last data \\
\hline 17 & 1 & 16 & Stop character \\
\hline
\end{tabular}

It is also possible to set date/time using the M-Bus data type F;
\begin{tabular}{|l|l|l|l|}
\hline Byte No. & Size & Value & Description \\
\hline 1 & 1 & 68 & Start character \\
\hline 2 & 1 & 09 & L-field, calculated from C field to last user data \\
\hline 3 & 1 & 09 & L-field, repeated \\
\hline
\end{tabular}
\begin{tabular}{|l|l|l|l|}
\hline Byte No. & Size & Value & Description \\
\hline 4 & 1 & 68 & Start character \\
\hline 5 & 1 & \(53 / 73\) & C-field, SND_UD \\
\hline 6 & 1 & xx & A-field, address \\
\hline 7 & 1 & 51 & Cl-field, data send, LSB first \\
\hline 8 & 1 & 04 & DIF size, 32 bit integer \\
\hline 9 & 1 & \(6 D\) & \begin{tabular}{l} 
VIF time/date
\end{tabular} \\
\hline \(10-13\) & 1 & xxxxxxxx & \begin{tabular}{l} 
Time and date. Min,hour,day,month, year coded ac- \\
corded to M-Bus data type F: \\
- Minutes in bits 0-5. Valid values 0-59 \\
- Hours in bits 8-12. Valid values 0-23 \\
- Day in bits 16-20. Valid values 1-31 \\
- Month in bits 24-27. Valid values 1-12 \\
- Year in bits 21-23 and 28-31 (MSB bits). \\
Valid values 0-99. All other bits are unused
\end{tabular} \\
\hline 14 & 1 & xx & CS checksum, calculated from C field to last data \\
\hline 15 & 1 & 16 & Stop character \\
\hline
\end{tabular}

\subsection*{10.4.26 Set date}

The date is set by sending the following command (all values are hexadecimal).
The command is affected by the write protection level set.
\begin{tabular}{|l|l|l|l|}
\hline Byte No. & Size & Value & Description \\
\hline 1 & 1 & 68 & Start character \\
\hline 2 & 1 & 07 & L-field, calculated from C field to last user data \\
\hline 3 & 1 & 07 & L-field, repeated \\
\hline 4 & 1 & 68 & Start character \\
\hline 5 & 1 & \(53 / 73\) & C-field, SND_UD \\
\hline 6 & 1 & xx & A-field, address \\
\hline 7 & 1 & 51 & Cl-field, data send, LSB first \\
\hline 8 & 1 & 02 & DIF size, 16 bit integer \\
\hline 9 & 1 & 6 C & VIF date \\
\hline \(10-11\) & 1 & xxxx & \begin{tabular}{l} 
Date (day,month,year coded accorded to M-Bus data \\
type G)
\end{tabular} \\
\hline 12 & 1 & xx & CS checksum, calculated from C field to last data \\
\hline 13 & 1 & 16 & Stop character \\
\hline
\end{tabular}

\subsection*{10.4.27 Reset demand, previous values, load profile and logs}

All data for demand, previous values, load profile and logs is cleared by sending the following command (all values are hexadecimal). The command is affected by the write protection level set.
\begin{tabular}{|l|l|l|l|}
\hline Byte No. & Size & Value & Description \\
\hline 1 & 1 & 68 & Start character \\
\hline 2 & 1 & 08 & L-field, calculated from C field to last user data \\
\hline
\end{tabular}
\begin{tabular}{|c|c|c|c|}
\hline Byte No. & Size & Value & Description \\
\hline 3 & 1 & 08 & L-field, repeated \\
\hline 4 & 1 & 68 & Start character \\
\hline 5 & 1 & 53/73 & C-field, SND_UD \\
\hline 6 & 1 & xx & A-field, address \\
\hline 7 & 1 & 51 & CI-field, data send, LSB first \\
\hline 8 & 1 & 00 & DIF size, no data \\
\hline 9 & 1 & FF & VIF next byte is manufacturer specific \\
\hline 10 & 1 & F9 & VIF extension of manufacturer specific VIFE's, next VIFE specifies actual meaning \\
\hline 11 & 1 & XX & \begin{tabular}{l}
VIFE specifies data to be cleared: \\
- 82: Demand \\
- 83: Previous values \\
- 84: Load profile \\
- 85: Event log \\
- AE: System log \\
- B0: Net quality log \\
- B1: Settings log
\end{tabular} \\
\hline 12 & 1 & 07 & VIFE clear \\
\hline 13 & 1 & xx & CS checksum, calculated from C field to last data \\
\hline 14 & 1 & 16 & Stop character \\
\hline
\end{tabular}

\subsection*{10.4.28 Reset resettable active energy import}

Reset of resettable active energy import is performed by sending the following command (all values are hexadecimal). The command is affected by the write protection level set.
\begin{tabular}{|l|l|l|l|}
\hline Byte No. & Size & Value & Description \\
\hline 1 & 1 & 68 & Start character \\
\hline 2 & 1 & 08 & L-field, calculated from C field to last user data \\
\hline 3 & 1 & 08 & L-field, repeated \\
\hline 4 & 1 & 68 & Start character \\
\hline 5 & 1 & \(53 / 73\) & C-field, SND_UD \\
\hline 6 & 1 & \(x x\) & A-field, address \\
\hline 7 & 1 & 51 & Cl-field, data send, LSB first \\
\hline 8 & 1 & 00 & DIF size, no data \\
\hline 9 & 1 & 84 & VIFE specifying energy \\
\hline 10 & 1 & FF & VIFE next byte is manufacturer specific \\
\hline 11 & 1 & F2 & Resettable registers \\
\hline 12 & 1 & 07 & VIFE clear \\
\hline 13 & 1 & xx & CS checksum, calculated from C field to last data \\
\hline 14 & 1 & 16 & Stop character \\
\hline
\end{tabular}

\subsection*{10.4.29 Reset resettable active energy export}

Reset of resettable active energy export is performed by sending the following command (all values are hexadecimal). The command is affected by the write protection level set.
\begin{tabular}{|l|l|l|l|}
\hline Byte No. & Size & Value & Description \\
\hline 1 & 1 & 68 & Start character \\
\hline 2 & 1 & 09 & L-field, calculated from C field to last user data \\
\hline 3 & 1 & 09 & L-field, repeated \\
\hline 4 & 1 & 68 & Start character \\
\hline 5 & 1 & \(53 / 73\) & C-field, SND_UD \\
\hline 6 & 1 & xx & A-field, address \\
\hline 7 & 1 & 51 & CI-field, data send, LSB first \\
\hline 8 & 1 & 80 & DIF size, no data \\
\hline 9 & 1 & 40 & DIFE, unit=1 \\
\hline 10 & 1 & 84 & VIFE specifying energy \\
\hline 11 & 1 & FF & VIFE next byte is manufacturer specific \\
\hline 12 & 1 & F2 & Resettable registers \\
\hline 13 & 1 & 07 & VIFE clear \\
\hline 14 & 1 & xx & CS checksum, calculated from C field to last data \\
\hline 15 & 1 & 16 & Stop character \\
\hline
\end{tabular}

\subsection*{10.4.30 Reset resettable reactive energy import}

Reset of resettable active energy export is performed by sending the following command (all values are hexadecimal). The command is affected by the write protection level set.
\begin{tabular}{|l|l|l|l|}
\hline Byte No. & Size & Value & Description \\
\hline 1 & 1 & 68 & Start character \\
\hline 2 & 1 & 08 & L-field, calculated from C field to last user data \\
\hline 3 & 1 & 08 & L-field, repeated \\
\hline 4 & 1 & 68 & Start character \\
\hline 5 & 1 & \(53 / 73\) & C-field, SND_UD \\
\hline 6 & 1 & xx & A-field, address \\
\hline 7 & 1 & 51 & Cl-field, data send, LSB first \\
\hline 8 & 1 & 80 & DIF size, no data \\
\hline 9 & 1 & 80 & DIFE, unit=0 \\
\hline 10 & 1 & 40 & DIFE unit=2 \\
\hline 11 & 1 & 84 & VIFE specifying energy \\
\hline 12 & 1 & FF & VIFE next byte is manufacturer specific \\
\hline 13 & 1 & F2 & Resettable registers \\
\hline 14 & 1 & 07 & VIFE clear \\
\hline 15 & 1 & xx & CS checksum, calculated from C field to last data \\
\hline 16 & 1 & 16 & Stop character \\
\hline
\end{tabular}

\subsection*{10.4.31 Reset resettable reactive energy export}

Reset of resettable active energy export is performed by sending the following command (all values are hexadecimal). The command is affected by the write protection level set.
\begin{tabular}{|l|l|l|l|}
\hline Byte No. & Size & Value & Description \\
\hline 1 & 1 & 68 & Start character \\
\hline 2 & 1 & 0 A & L-field, calculated from C field to last user data \\
\hline 3 & 1 & 0 A & L-field, repeated \\
\hline 4 & 1 & 68 & Start character \\
\hline 5 & 1 & \(53 / 73\) & C-field, SND_UD \\
\hline 6 & 1 & xx & A-field, address \\
\hline 7 & 1 & 51 & Cl-field, data send, LSB first \\
\hline 8 & 1 & 80 & DIF size, no data \\
\hline 9 & 1 & C0 & DIFE, unit=1 \\
\hline 10 & 1 & 40 & DIFE unit=3 \\
\hline 11 & 1 & 84 & VIFE specifying energy \\
\hline 12 & 1 & FF & VIFE next byte is manufacturer specific \\
\hline 13 & 1 & F2 & Resettable registers \\
\hline 14 & 1 & 07 & VIFE clear \\
\hline 15 & 1 & xx & CS checksum, calculated from C field to last data \\
\hline 16 & 1 & 16 & Stop character \\
\hline
\end{tabular}

\subsection*{10.4.32 Freeze demand}

The demand values will be frozen and a new period will be started by sending the following command (all values are hexadecimal). The command is affected by the write protection level set.
\begin{tabular}{|l|l|l|l|}
\hline Byte No. & Size & Value & Description \\
\hline 1 & 1 & 68 & Start character \\
\hline 2 & 1 & 08 & L-field, calculated from C field to last user data \\
\hline 3 & 1 & 08 & L-field, repeated \\
\hline 4 & 1 & 68 & Start character \\
\hline 5 & 1 & \(53 / 73\) & C-field, SND_UD \\
\hline 6 & 1 & xx & A-field, address \\
\hline 7 & 1 & 51 & CI-field, data send, LSB first \\
\hline 8 & 1 & 00 & DIF size, no data \\
\hline 9 & 1 & FF & VIF next byte is manufacturer specific \\
\hline 10 & 1 & F9 & \begin{tabular}{l} 
VIF extension of manufacturer specific vife's, next \\
vife specifies actual meaning
\end{tabular} \\
\hline 11 & 1 & 82 & VIFE specifying demand \\
\hline 12 & 1 & \(0 B\) & VIFE freeze \\
\hline 13 & 1 & xx & CS checksum, calculated from C field to last data \\
\hline 14 & 1 & 16 & Stop character \\
\hline
\end{tabular}

\subsection*{10.4.33 Set write access level}

The write access level is set by sending the following command (all values are hexadecimal). The command is affected by the write protection level set.
\begin{tabular}{|l|l|l|l|}
\hline Byte No. & Size & Value & Description \\
\hline 1 & 1 & 68 & Start character \\
\hline 2 & 1 & 07 & L-field, calculated from C field to last user data \\
\hline 3 & 1 & 07 & L-field, repeated \\
\hline 4 & 1 & 68 & Start character \\
\hline 5 & 1 & \(53 / 73\) & C-field, SND_UD \\
\hline 6 & 1 & xx & A-field, address \\
\hline 7 & 1 & 51 & Cl-field, data send, LSB first \\
\hline 8 & 1 & 01 & DIF size, 8 bit integer \\
\hline 9 & 1 & FF & VIF next byte is manufacturer specific \\
\hline 10 & 1 & 6 A & VIFE write control \\
\hline 11 & 1 & xx & \begin{tabular}{l} 
Write control (1: Closed, \(2:\) Open by password, 3: \\
Open)
\end{tabular} \\
\hline 12 & 1 & xx & CS checksum, calculated from C field to last data \\
\hline 13 & 1 & 16 & Stop character \\
\hline
\end{tabular}

\subsection*{10.4.34 Set tariff source}

Tariffs can be controlled by inputs, communication or internal clock.
The tariff source is set by sending the following command (all values are hexadecimal). The command is affected by the write protection level set.
\begin{tabular}{|l|l|l|l|}
\hline Byte No. & Size & Value & Description \\
\hline 1 & 1 & 68 & Start character \\
\hline 2 & 1 & 08 & L-field, calculated from C field to last user data \\
\hline 3 & 1 & 08 & L-field, repeated \\
\hline 4 & 1 & 68 & Start character \\
\hline 5 & 1 & \(53 / 73\) & C-field, SND_UD \\
\hline 6 & 1 & xx & A-field, address \\
\hline 7 & 1 & 51 & Cl-field, data send, LSB first \\
\hline 8 & 1 & 01 & DIF size, 8 bit integer \\
\hline 9 & 1 & FF & VIF next byte is manufacturer specific \\
\hline 10 & 1 & F9 & \begin{tabular}{l} 
VIF extension of manufacturer specific VIFE's, next \\
VIFE specifies actual meaning
\end{tabular} \\
\hline 11 & 1 & 06 & VIFE tariff source \\
\hline 12 & 1 & xx & \begin{tabular}{l} 
Tariff source (0: Internal clock, \(1:\) Communication \\
command, \(2:\) \\
Inputs \()\)
\end{tabular} \\
\hline 13 & 1 & xx & CS checksum, calculated from C field to last data \\
\hline 14 & & 16 & Stop character \\
\hline
\end{tabular}

\subsection*{10.4.35 Set CO2 conversion factor}

The co2 conversion factor is set by sending the following command (all values are hexadecimal). The command is not affected by the write protection level set.
\begin{tabular}{|l|l|l|l|}
\hline Byte No. & Size & Value & Description \\
\hline 1 & 1 & 68 & Start character \\
\hline 2 & 1 & 0 A & L-field, calculated from C field to last user data \\
\hline 3 & 1 & 0 A & L-field, repeated \\
\hline 4 & 1 & 68 & Start character \\
\hline 5 & 1 & \(53 / 73\) & C-field, SND_UD \\
\hline 6 & 1 & xx & A-field, address \\
\hline 7 & 1 & 51 & Cl-field, data send, LSB first \\
\hline 8 & 1 & 04 & DIF size, 32 bit integer \\
\hline 9 & 1 & FF & VIF next byte is manufacturer specific \\
\hline 10 & 1 & 24 & VIFE CO2 conversion factor in g/kWh \\
\hline \(11-14\) & 4 & xxxxxxxx & CO2 conversion factor \\
\hline 15 & 1 & xx & CS checksum, calculated from C field to last data \\
\hline 16 & 1 & 16 & Stop character \\
\hline
\end{tabular}

\subsection*{10.4.36 Set currency conversion factor}

The currency conversion factor is set by sending the following command (all values are hexadecimal). The command is not affected by the write protection level set.
\begin{tabular}{|l|l|l|l|}
\hline Byte No. & Size & Value & Description \\
\hline 1 & 1 & 68 & Start character \\
\hline 2 & 1 & 0 A & L-field, calculated from C field to last user data \\
\hline 3 & 1 & 0 A & L-field, repeated \\
\hline 4 & 1 & 68 & Start character \\
\hline 5 & 1 & \(53 / 73\) & C-field, SND_UD \\
\hline 6 & 1 & xx & A-field, address \\
\hline 7 & 1 & 51 & Cl-field, data send, LSB first \\
\hline 8 & 1 & 04 & DIF size, 32 bit integer \\
\hline 9 & 1 & FF & VIF next byte is manufacturer specific \\
\hline 10 & 1 & 25 & VIFE currency conversion factor \\
\hline \(11-14\) & 4 & xxxxxxxx & \begin{tabular}{l} 
Currency conversion factor in currency/kWh with 3 \\
decimals
\end{tabular} \\
\hline 15 & 1 & xx & CS checksum, calculated from C field to last data \\
\hline 16 & 1 & 16 & Stop character \\
\hline
\end{tabular}```

[^0]:    * The value is a mean value of the period.
